

# ARCADIAN

November 10, 1981

Volume 4 Number 1

PURPOSE of the ARCADIAN is to act as a user-dominated forum for the dissemination of material having to do with the Bally/AstroVision Arcade cum computer. We include programs, operational hints, tutorials, and hardware items of value. The underlying reason for the paper is to help us all understand how and why the machine operates the way it does. We can then make it operate the way we want it to and expand its usefulness.

HISTORY in a nutshell - The Chicago mail order house of JS&A advertised the Bally system in popular magazines in late 1977, and a number of us bought the unit. There were lots of promises of expansion capability and actual hardware to be available in mid-1978. Delivery was poor, some of the promised material never did show up. The Basic cartridge did appear and I started this paper in November, 1978. I got tired of waiting for the Add-On memory expansion and was about to contract to get one made for us, when the Fidelity Electronics purchase became imminent. We took a second look and opted out, because there was no way we could compete with a factory product. We started to look at smaller projects, and eventually the expansions called 'Blue Ram' and 'Viper' became available. AstroVision finally took over the Bally Consumer Products Div. product, and is now aggressively moving ahead with new videocades and the AddUnder expansion unit.

TECHNICAL ASPECTS of this paper include the fact that all typing is done on an Apple, using the Super Text word processor system, and the output is printed of a Comprint 912S electrostatic printer. Programs are printed using the Arcade as the driver, using the \*PRINT command and a tap from the cassette interface. A minor inconvenience is that the printer does not have a divide sign, a multiply sign, or a right arrow - instead, it prints out a lower case letter, as follows:

a = right arrow → b = multiply × c = divide +

CALIFORNIA HERE I COME! is being heard around the halls of AstroVision! Yes, they are moving their offices to a small town near Sacramento, and will have a second production facility there. The move is taking place about the time you will be receiving this. The new address will be 11167 Trade Center Drive, Suite D, Rancho Cordoba, CA 95670.

## ASTROVISION BASIC FEATURES: EDITOR

Editing of programs is now considerably easier. The operation is: Type the line number of the line to be corrected. Press PAUSE repeatedly to recall each individual entry in the line, one by one. Use ERASE to back up (and therefore eliminate) an entry, allowing the typing in of additional or replacement entries.

You can continue to PAUSE until the entire line is shown, and one more entry will act as the GO command. As a short cut, if you make a change in the beginning of a long line, instead of using PAUSE repeatedly to get to the end of the line, use WORDS SPACE to enter the entire corrected line.

Utilization: After entering a taped program, I LIST the program and watch for ??. Mark down the line numbers where these appear, and when the whole program has been listed, I go back to correct each line. List the single line using LIST nnn,1 where nnn is the line number (the comma and 1 tell the machine to just list one line). Then I look to see where the ?? tells me the problem is, use the PAUSE control, etc., as described above to make the corrections, and finally re-list the line to see that it is correct.

This page is written for the new ARCADIAN reader, to give him a very short updating to today's status.

### WHAT HAVE I BOUGHT???

The Arcade machine that you have contains four built-in programs as described in the literature that came with the machine, and it will accept Videocades in the game slot for other games, as produced by AstroVision/Bally. One of these Videocades is entitled "Basic", and insertion of this cartridge will allow you to access the Z-80 microprocessor located inside the machine, and that is what we are all about. The machine contains three custom circuits, not available in any other TV game, that help the Z-80 perform. These special circuits are enclosed in three integrated circuit chips called DATA, INPUT/OUTPUT, and ADDRESS. Also included is a memory consisting of approximately 4000 bytes of Random Access Memory (RAM), and 8000 bytes of Read Only Memory (ROM). When you insert the Basic cartridge, you can personally enter a program of up to 1800 bytes into the 4000 byte RAM. The Basic is derived from "Palo Alto Tiny Basic" written by Dr. L. Wang a number of years ago. A listing and discussion of this language is contained in Volume One of "Dr. Dobbs' Journal of Computer Calisthenics and Orthodontia" (Still available at some of the bigger computer outlets.) We can supply a listing with remarks of both the Bally Basic and the AstroVision Basic. Both of these Basics were written by Jay Fenton.

As mentioned above, the largest program that can be entered into the Arcade is 1800 bytes. While some clever program entries have been made to utilize this space efficiently, it is woefully small for any serious programming. To alleviate that problem, three avenues of enlargement are available:

ooo 1.The AstroVision Add Under. This item is currently in a pre-production prototype construction phase. That is, all the critical design parameters have been set and some hand-wired units are being built to test the concept. Meanwhile, the printed circuit board is being laid out for the production version. These prototypes will be available for show/operation at the Consumer Electronics Show (CES) early next year (where most new products are shown to wholesalers). By that time the production system should be moving along well enough so that hardware will be available by February or March for deliveries to start. We shall see. The Add Under will have enough memory for any reasonable program, and a new, different, language called ZGRASS. Its projected cost is \$600.

ooo 2.The Perkins Engineering "Blue Ram". This memory addition allows you to expand your programs by 4000 bytes. It plugs directly onto the 50-pin connector at the back of the Arcade, and has a separate power supply. In addition to providing raw memory for programming, numerous 'extras' are included or available to enhance its operation. A keyboard can be attached, for example, and a new language cartridge was just announced. 1004 Pleasant Ave., Boyne City, MI, 49712

ooo 3.Alternative Engineering produces the "Viper System", which has a modular approach to memory expansion. A large box contains a power supply and one (Viper 1) or more (Viper 5 or 10) memory cards (each card has about 16000 bytes). The Arcade sits on top of the Viper box and is connected by a short cable using the 50-pin connector at the rear. A keyboard is available as an extra. The Viper package includes a free copy of the Extended Basic language on tape. P.O.Bx 12B, Gardiner, ME 04345

Author Steve Walters has sent us a variation and explanation of the loading method he suggests for his program that was listed in the last issue, p.126.

The technique used to load the HALLOWEEN GRAPHICS program involves the direct mode (i.e., no line numbers used). A general explanation was printed in the ARCADIAN in Vol.3, No. 2, p. 20-21 (Dec., 1980) with a correction added in Vol.3, No. 3, p. 31 (Jan., 1981).

For the HALLOWEEN GRAPHICS program, the specific tape-loading procedure is as follows, after you have entered the program (ARCADIAN p. 126) in the computer:

1. enter the following in direct mode (no line number):

```
:PRINT; TV=0; TV=1; PRINT; PRINT ".HALLOWEEN GRAPHICS";
PRINT ".BY S. WALTERS 10/80"; PRINT; LIST; PRINT;
PRINT ".STANDBY FOR"; PRINT ":RETURN; :INPUT 2"
```

Do not press GO yet. Turn your tape recorder on "record" to record the program, then press GO.

You will see ?? for the input code, then the title, then the program list. When you see the last item (:RETURN; :INPUT 2) appear on the screen, immediately turn off the tape recorder, but do no rewind the tape.

2. We will now add the data trailer to the tape. Clear the computer memory, then enter LINES 10 thru 40 on ARCADIAN page 127.

Then in direct mode enter :PRINT; RUN but do not press GO yet. Turn your tape recorder on "record" to record the data, then press GO.

Again you will see ?? for the input code, then the data print on the screen, and then the last item (:RETURN; RUN). Turn the tape recorder off, rewind, and clear the computer memory.

3. The tape is now ready to load and will run automatically when input is completed. Load the tape into the computer using :INPUT 1 since the TV input code "1" was used.

The actual input operation involves the following for the computer:

```
:INPUT 1 opens the input port, and the computer then responds to
the input code 1 by inputting the title (which is ignored by the
computer since the period precedes the characters) and the program.
:RETURN instruction then closes the input port, and the :INPUT 2
reopens the port for an input code 2. This eliminates the junk
which results if the tape is simply stopped and restarted for the
two taping steps.
```

The input code 2 causes the computer to input the data, :RETURN
then closes the input port and RUN causes the program to start
automatically at the end of the loading.

\*\*\* BLUE RAM SUPER EXTENDED BASIC \*\*\* FOR USE WITH THE BLUE RAM AND ITS ACCESSORIES. THIS LANGUAGE COMES IN A NORMAL CARTRIDGE AND HAS ALL OF THE FEATURES OF THE STANDARD BALLY BASIC -PLUS- ALL OF THESE ADDITIONAL FEATURES BY JAY FENTON AND (\*PERKINS ENGINEERING:

- 4 COLORS ON THE SCREEN AT ONCE
- FASTER OVERALL PROGRAM EXECUTION
- 5 ADDITIONAL GRAPHICS COMMANDS
- "WINDOWED" GRAPHICS AND TEXT
- 2 CHARACTER FONTS (5X7 AND 3X5)
- CHANGEABLE PRINT NUMBER BASE
- "TRACE" PROGRAM DEBUG AID
- LARGER PROGRAM AREA (31000 BYTES)
- 14 NEW TWO-LETTER VARIABLES
- 3 ADDITIONAL DATA SET COMMANDS
- PROGRAM "BOMB" RECOVERY\*
- FASTER MULTIPLY AND DIVIDE\*
- BUILT-IN DRIVER FOR THE BR KEYBOARD\*
- BUILT-IN DRIVER FOR THE BR PRINTER\*
- FULL SOUND EFFECTS / MUSIC DRIVER\*
- 300 AND 2000 BAUD TAPE INTERFACES\*
- FULL BOOLEAN OPERATIONS\*
- NEGATE OPERATOR\*
- VERSATILE PROGRAM LINE EDITOR\*
- USER EXTENSIBLE COMMAND LINKAGE\*
- EXTENDED GOTO AND GOSUB FORMATS\*
- 8 MODES CONTROLLED BY MODE FLAGS\*
- 5 SERVICE LINKAGES IN RAM\*

THIS CARTRIDGE COMES COMPLETE WITH 2000 BAUD INTERFACE CABLE AND DOCUMENTATION DEFINING THE NEW LANGUAGE FORMATS FOR \$49.95 FROM PERKINS ENGINEERING

1004 PLEASANT AVE.

BOYNE CITY, MICHIGAN 49712. (616) 582-9832

40Z is an interesting graphics program that has a number of subtleties, made up by Rusty Blommaert and Dale Smith.

George Moses added lines 3000 and 3010 as a tool for getting the string variables loaded onto tape once you have entered them into the computer, as follows:

Enter the entire program, down through line 3010, then RUN. The program will first review the contents of @(), because of line 2400V, and since the contents are now 0, it will start the process of asking you to enter the string variables, @ through 87. Enter these from the list on the right. When through, RUN the program again. This time, when the program looks at @(), it will see the desired 6693, and will jump to line 2450 and continue. Now, to load the program on tape, and save all those strings you just finished loading, HALT the program while it is running, start your tape recorder on RECORD, and enter GOTO 3000. You will see some strange activity as the entire program is loaded at the top of the screen only - have no fear, its ok.

## CONTEST ENTRIES this month are three:

- o 4D2, which is a purely graphics presentation that gives you something soothing to look at and admire. While the program appears random, I am told that it is a giant loop that starts again in about three days. There is a lot of machine language code in it, and it runs in Bally Basic only. The authors are working on an AstroVision Basic version.
- o Nuclear Math is an arithmetic training game that asks the operator to perform math problems. Correct answers will cool the nuclear reactor thermometer, while incorrect ones will drive the temperature up to a calamity.
- o Code-Decode is a 'utility' program that is used for a specific purpose. The program will automatically encrypt a message using some special rules. Only another Arcade with the same program will be able to decrypt the message. Note that this is not a substitution type of code, but real encryption, where a single letter does not always have the same meaning.

BLUE RAM EXTENDED BASIC cartridges are now being delivered. See their ad for details of the cartridge. Attach the Blue Ram memory addition, and then insert the Blue Ram cartridge. The screen goes blue and the title (as printed above) comes up. Then the cursor shows up in the small font format, as does anything entered. By using CF=LARGE, the font size changes to the standard. If you have the Ble Ram Keyboard, it can be attached, and all entries made through it. The ROM cartridge contains the keyboard operating system, eliminating the old tape entry method.. The keypad works as well. We'll be including some tutorials and programs for the Ram's new Basic cartridge very soon.

Advertisements - The two or three-line items on the last page are free to subscribers until they get overwhelming. Small display ads up to 1/4 page are also free. Send for rates on half-page or larger ads.

Programs in the ARCADIAN are entirely the work of subscribers. Programs should be sent on a tape (if you have the Bally Basic, I prefer it that way), accompanied by a listing (which may be hand written, as long as it is legible - we only use it in case the tape fails), and a complete description as to operation, etc., of the program. Submittal of a program is considered to be a donation for the common betterment and education of all, and no payment is made. We do, however, have a monthly contest. Any program submitted to the contest requires a statement that the program is an original work and not a copy of an existing program. Contestants will vie for a \$100 prize, supplied by the ARCADIAN. We have a 5-man rotating judging panel who use their own criteria to decide between contestants. There must be at least two entrants for the contest to operate. At the end of the Volume year, we go back and select 10 of the most popular programs from the entire stock (except contest winners), and make up a tape to be sold by dealers and directly. Sales of these "Best of ARCADIAN, 198x" programs will result in royalty payments to the authors.

PLEASANT DILEMMA is caused by having both the Blue Ram and Viper extended memory systems here, and having to pick and choose which one to plug into the Arcade. Well, there are two Arcades here now, each with an extended memory and so we will be able to try out both systems in parallel, entering programs into both to check operation and compatibility.

The Bit Fiddlers will be presenting a cartridge that will allow machine code programming directly from the keyboard later this month. Expect a full ad in the next issue.

# NEW 3 VOICE MUSIC ASSEMBLER FEATURING NO REM STATEMENTS!

BY GEORGE MOSES

In May, 1980 The Arcadian published an introduction of three-voice music programming to Bally Basic aficionados. I received this program, previously thought impossible in Basic, from its creator, Brett Bilbrey of Dearborn, Michigan and spent about 3 months refining it to make it more easily used and understood by Arcadian Subscribers.

This program opened the door to a new realm of creative expression with my Arcade and I spent hundreds of hours programming sheet music. Along the way, I made changes in the program to clean up the timing problems inherent in the many counting loops and IF statements of the original program. That whole program has now faded into obsolescence as new discoveries have initiated a complete overhaul of the music assembly methods used in the past. Somewhere you have to quit changing a program and say, finally, "This is the way it's gonna be!" That's the program we've included here.

Shortly before completing it, I received a letter from Jim Dunson in Pensacola, Florida that led to the biggest and final revision, the elimination of REM () statements for storing the poked data. Jim discovered that you can poke data into the text memory area beyond %20050, which is the memory address of the SZ indicator at the end of your program. If you command the computer to PRINT %20050 GO It will print out the memory address of the end of the program. The advantage of this method is that you no longer have to type in those long REM statements at the beginning of the program to store your data. However, you need to use a new method to write the data to tape as your computer won't list the data beyond %20050. So, I've included a print-to-tape subroutine beginning on line 15 and created for this purpose by Dave Ibach of Northville, Michigan.

## THE MUSIC PROGRAM

BY GEORGE MOSES

With the help of Brett Bilbrey, Jim Dunson & Dave Ibach

## SAMPLE DURATION CHART

(If song's shortest note is 16th note)

	INPUT
16th	.1
8th	.2
Quarter	.4
Half	.8
Whole	1.6

FIG. 1

Song's shortest note is the reference point receiving a duration of 1. Then, each advance in note category doubles in duration value.

After you've input the program, record it on tape for safekeeping. Then press RUN and GO. The screen will clear and you'll see the beginning address of the first chord at the top of the screen. Using the notes from your sheet music converted to the numbers on the note chart (FIG 2), input the 3 notes in your first chord. Then the computer will ask for the duration of the chord. (See FIG. 1). The duration of a chord is determined by the shortest note in the chord. If all three notes are of identical length there's no problem. Any notes of longer duration than the shortest sounding note should be carried into the next chord and even into the chords following, if necessary, until their total duration has been accounted for. When carrying a note through two or more chords input it into the same voice and it will continue to play as one continuous, but longer sounding note. To play the same note in successive staccato beats just input it into a different voice for each chord. (See FIGS. 3 & 4)

### ONE CONTINUOUS CHORD

Voice A	26	26
Voice B	39	39
Voice C	50	50
Duration	4	4

FIG. 3

### TWO DISTINCT CHORDS

Voice A	26	26
Voice B	39	39
Voice C	50	50
Duration	4	4

FIG. 4

To illustrate FIG. 3, press WORDS RUN GO to get the program running. Input the first chord thusly:

26 GO  
39 GO  
50 GO

4 GO Allow an interval of time after the Duration entry for the computer to perform the pokes to memory. Then go to the next chord and repeat the process. To hear the two chords type:  
333 GO and the computer will ask "START AT?" Type:  
B GO

Listen! It's just one long, continuous chord. Now input FIG. 4. Select CHANGE from the menu. Then the computer will ask: "ADDRESS OF CHORD?" Type "B" to get back to the beginning of data storage and input FIG. 4 just as you did FIG. 3. Listen to the two chords in FIG. 4. You heard two distinct chords, didn't you? That's what happens when you switch the notes to different voices in succeeding chords. If you have less than 3 notes in a chord, or no notes at all, as in a rest, just input a zero into any voice not being used.

After you input a duration the computer will poke the entire chord into memory as many times as the duration number you selected. Then the screen will print the beginning address of the next chord. Anytime you wish to hear the music played up to the last chord you've input, just put in a number greater than 256. I like to use 333. (Don't do this when the computer is asking for a duration or that chord will be poked into memory 333 times, using 999 bytes of memory faster than you can say "OOOPS".)

Next you'll be asked for the "START" address of the music. If you want to hear the song from the beginning simply input B, which stores the memory address of the first chord. To begin listening in the middle of the song, input the memory address of the chord you want to start at. To hear it again, press the number 1. To resume inputting data where you left off press 2. To change a chord that doesn't sound right press 3. If you press 3 you'll be ask-

ed for a starting location for changing notes. The same rule applies as for hearing music. Input B for starting at the beginning, or use the chord address to start at a specific chord in the middle of the song.

To keep track of where chords are in memory I mark the chord address at the end of each measure on the sheet music. Then I can easily return to the beginning of any measure to hear or change my music. If at any time you input a wrong note and are immediately aware of it, if you haven't put in the duration for that chord yet HALT the computer and press RUN GO. You'll be inputting at the beginning of the same chord you were just working on because the computer doesn't execute a poke to memory until you input the duration. If you have already input the duration, you can get back to the chord you want to correct by pressing HALT. Then set the variable E equal to the address of the chord you want to correct. RUN the program and you'll be back at that chord. Type in the correct numbers and work forward from there. The timing on this program is very accurate because a chord is poked into memory in sequence as many times as the number of its duration. When the song is played the computer peeks into the locations in the same way, reading the musical data at a constant speed.

The data is read and played by line 2 which is a subroutine of line 8. The starting location of each block of music is stored in the variable A and the end is stored in E. The significance of this is that you can play the entire song with the statement

8 GOSUB 2.

To play the song twice as in a repeat bar just use the statement

**8 GOSUB 2;GOSUB 2**

which calls the subroutine twice. If you want to repeat only a portion of the music you would preface your second GOSUB with A = -nnnnn;E = -nnnnn; where A is the beginning memory address of the block and E is the ending address so the computer will know where to start and stop reading the data.

**CAUTION:**With this program the data is stored in memory addresses just beyond the end of the program, so you can't add any bytes to its length once you start inputting or you'll destroy the beginning of your data. You can remove bytes with no effect at all. In fact, once you're done inputting a song you can eliminate lines 4, 5, 11 and 12. But remember that this will make the [2]INPUT and the [3]CHANGE menu selections inoperative.

The speed of the music is controlled by the variable T in line 7. The lower the value of T, the faster the music will play. Line 8 is a good place to print the title of your song on the screen. Just be sure you've removed enough bytes of program to make room for

NOTE	VALUE	SHARP	FLAT

FIG. 2

### THE MUSIC FROM THE BALLY DEMO CARTRIDGE

Run the program and input the following data in columns of four. For example, the first chord is input like this:

**24 GO** Then move one column to the right and continue. When you want to hear the music up to the last chord you've input, type 333 GO. Then input B when asked for the starting address. This is the Bach Allemande you may have heard on the Bally DEMO cartridge your dealer uses to display the Arcade at point of purchase. If you'd like to hear the complete 865 bytes of this song you can find the sheet music for this piece in Schirmer's Library of Musical Classics, Vol. 20, Bach Partitas For the Piano, Book 1, priced at \$3.50 at your local music store. This allemande is on page 6. In this case every chord has a duration of 1.

If you are interested in buying the sheet music then send a blank tape and \$2.00 to me at P.O. Box 686, Brighton, MI 49116. I'll put the

INTRODUCTORY OFFER: New ARCADE PLUS (with ASTROVISION BASIC) \$250.

R. Fabris, Purposeful  
3626 Morrie Dr.  
San Jose, CA 95127-9990

EXTENDED MEMORY SYSTEMS I've had the opportunity to use the two extended memory systems - The Blue Ram and The Viper 1 - this past month, though not as much as I would have liked. Actually, the efforts has gone into using the Extended Basic Language we now have in each format, so I have been playing with circles, and snapshots... Recall that the Blue Ram version is on a cartridge, so that none of the Blue Ram available memory space is taken up with the language. Programs can be entered directly when the machine is turned on. The cartridge version allows inputs at either 300 or 2000 baud rate (use :INPUT and the attached tape recorder jack for the 2000 baud program, or :INPUT300 and the old cassette interface for a 300 baud program.) Of course, outputs are done in a similar fashion. Also available is the \*PRINT function, which allows printer operation.

In the other version, the Viper arrived with a couple of taped programs, and I entered these into the Blue Ram to see how they would work, and also to get the printing done. With regard to the Viper, its Extended Basic arrives on a tape to be loaded prior to utilization. This loading takes about 8 minutes. At completion of your first successful loading, Alternative Engineering recommends that you make some duplicate tapes using your own recorder, which is an excellent idea. The three other programs were:

- 1) A checksum program that is used to prove that you have a proper loading of the program, by calculating the sum of all the bytes in each 128-byte block. Each sum is about 15000. They provide a set of answers for each of the 63 blocks checked.
- 2) A graphics display program that acts as a sort of dictionary of the available commands, with illustrations of many of them.
- 3) A short display program that superimposes circles and boxes, in four colors, in a sort of kaleidoscope effect.

I must admit to a certain amount of laziness, as I plugged the Blue Ram Extended Basic Cartidge into the Viper to have instant turn-on, and avoid the long wait of loading the tape. And contrari-wise, I loaded the Viper's tapes into the Blue Ram system to avoid having to key in the data.

Both systems have their positive and negative features in detail, but in overall operation, etc., they are quite parallel, both doing essentially the same thing. I was very pleased to see that I could do the cross-over things mentioned above.

BUSINESS PROGRAMS NEEDED We occasionally receive a request for some sort of business program, a sort of difficult thing to do with the limited memory available in the Arcade. Those of you with a talent for accounts receivable and that kind of thing should be able to generate something using one or the other of the memory addition systems now available - (the Blue Ram and the Viper).

ZGRASS - the language of the Add-Under. We reported on p. 13 of Vol 3, of the availability of the DATAMAX UU-1 computer, which utilizes Dr. DeFanti's Zgrass language. The November issue of Creative Computing has an interesting article by one of the purchasers of the UU-1, and his experiences with the language. Note that some of the feature commands (SNAP, CIRCLE) are available in the Extended Basic, offered by both Blue Ram and Viper manufacturers.

ASTROVISION BASIC is the new Basic cartridge now appearing on the market. The original Bally Basic is not going to be generally available any more (we have a few here). We will certainly continue to support the older basic because there is a large world out there with them. Fortunately, the conversion required is quite minimal, and unless we identify otherwise, you can assume that whatever we print will work on both basics. We will use BB to identify Bally Basic and AB to identify AstroVision Basic programs where necessary. A similar code will be used when we list programs in Extended Basic or Zgrass languages.

CONVERSION of formats. What I'm speaking about here is the method of changing a program written in Bally Basic that tape-loads at a 300 baud rate into the AstroVision Basic tape loading rate of 2000 baud. The manual that comes with the AB cartridge has a program in machine language that does this. In essence, one enters this program into the AB cartridge by means of a tape and the :RUN command. Then the BB program is tape-loaded into the BB cartridge, one key is pressed and presto! the job is done. The program can now be tape-loaded at the 2000 baud rate. The manual wisely suggests that you make a number of copies of this conversion program for safe-keeping. At the moment, we prefer that all programs be submitted in Bally Basic, as we have not found a method to \*PRINT an output to a printer in the AB format. (Hackers take note)

MACHINE CODE PROGRAMMING is feasible using Bally Basic by going through some relatively inefficient ways to input the required data, segments of which have appeared in the ARCADIAN over the past three years.. This has been resolved by the Bit Fiddlers, who announce the availability of a new cartridge that will do all the work for you. See their ad.

This cartridge is intended to be a tool for the serious programmer and hardware type ('hacker'). A certain amount of familiarity with machine language principles (hex notation, how to look up instruction codes in microprocessor manuals, etc.), would allow a user to work with it almost immediately. The manual supplied with it is an attempt to bridge some of the gap between the novice and the experienced machine language type, but is not meant to take the place of a Z-80 programming handbook. Likewise, publications having information on the Bally on-board routines are a must if one plans to use the Machine Language Manager effectively. These routines are available in the document 'Executive Software', developed by Tom Wood, at \$3.00 first class, from the ARCADIAN.

In order to get a reasonable listing on the TV screen, the MLM uses its own 3x5 character set (very similar to that used in the Extended Basic). This smaller set places 39 characters on a line, but eats up a lot of memory in the unit. What is left is support of a printer and external keyboard through the cassette interface and the ability to produce self-starting program tapes.

Next in line will be game tapes to go along with the cartridge, with the first due in January. Then utilities to add to the machine language toolbox, and if enough people who have a keyboard also want a word processor, then a rudimentary one could be developed.

The Chicago group will have a copy at their next meeting for members' review.

# Home Video Game Invasion Has Begun

By Dan Dorfman

You probably never heard of Astrovision, Inc. and there's no reason you should have — located in Columbus, Ohio, it's a mere 14½ months old, privately owned and its sales last year were just over \$1 million. But its investment implications — based on what's happening to the company's business — are enormous. And obviously a number of corporate biggies think so. Example: International Telephone & Telegraph is quietly talking to the company about a joint venture in Europe. CBS, a little over a month ago, held hot and heavy talks that might have led to its acquiring the company. And RCA also looked into a joint venture with the firm.

The reason for all this interest: tiny Astrovision is in probably the hottest growth business in the country — the exploding home video game field.

Mr. Dorfman

In August of '80, Astrovision acquired the rights to the home video business of Bally Mfg. Co. — a video machine which attaches to the TV set, plus 25 software packages of various games — for \$2.3 million, plus royalties.

To date, the company's business has been going through the roof. Astrovision vice president Ray George estimates '81 sales at between \$12 million and \$15 million — with net profit running a little over \$1 million. And with a current order backlog of about \$55 million, he figures '82 should produce at least \$100 million in sales and around \$10 million in net earnings.

As George sees it, "There is a game craze over the country, in fact all over the world, and we intend to be a leader in it."

George regards the Bally sale of its home video game business to Astrovision as a "giant blunder" and suggests the company goofed badly by treating the operation as a stepchild.

He may be right, but Bally, which is the kingpin in the arcade and coin-operated pinball and video game business, is apparently taking steps of remedy that.

Sources tell me that Bally, within the next 60 days, will announce its intent to produce software packages expressly for home video machines.

Whether Astrovision — which talks optimistically of going public in early '82 and being a billion-dollar company in '85 — continues to achieve meteoric growth, and in fact even survives in the face of the almost certain surging competition, remains to be seen.

"If you tie in the personal computer, which is what many people will use to play these games, this home video revolution will be the single hottest investment area over the next three to five years," predicts Lee Isgur, Wall Street's top entertainment specialist.

The 44-year-old Isgur, an analyst at Paine Webber Mitchell Hutchins, tosses out some glowing numbers to support his case. By 1985, he figures hardware sales — the game machines which currently retail at \$199 to \$299 (although there's heavy discounting) — will represent a worldwide volume of between \$5 billion and \$10 billion; software, (generally \$20 to \$25 a cartridge), \$5 billion to \$15 billion.

## FINANCIAL NEWS

financial pages of the

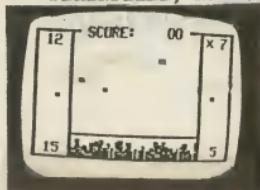

appeared on the

PBS TV show, Wall Street Week on November 20, at which time he included Bally as one of his three 'buy' recommendations.

The above column was included in a number of the country's newspapers on Oct. 29. Mr. Isgur

## Falling Stars!

Radiocative stars are descending onto the city below. If the city is hit, many lives will be lost. It's up to you to protect the city by destroying the stars before they reach the surface. If you enjoy 'Missile Command', you'll love 'Falling Stars' by Super Software. The speed and graphic will astound you. Also includes 'Laser Battle'. Only \$10.00 from Super Software. Order yours and have hours of fun.

## I-O SWITCH FOR NEW BALLY BASIC CARTRIDGE

by Steve Walters

The new Bally (Astrovision) Basic cartridge has a single audio jack for tape input-output. This requires the operator to switch the audio cable back and forth between the tape recorder's "mike" jack for output (:PRINT) and the "ear" jack for input (:INPUT). This cable switching is a nuisance, and is easy to forget.

I have overcome this by providing a switch on my computer to eliminate the physical switching of the audio cables. This required a modification of my tape recorder also.

**Computer-mounted switch.** Mount a double-pole double-throw (DPDT) miniature-size switch (like Radio Shack No. 275-614) at a convenient location on the computer case. Make sure there is room inside the case for the switch and its wires to clear other components.

Run three audio cables through holes at convenient locations in the case and connect to the switch as shown in the illustration. Note that Cable #B must be long enough to reach the jack on the New Bally Basic Cartridge, and Cables A and C must be long enough to reach your tape recorder. A good source for the audio cables is a six-foot extension cable with a miniature phone plug on each end (like Radio Shack No. 42-2420) which can be cut in half to make two of the required cables.

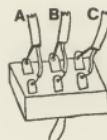

A variation which may be preferred for some equipment set-ups is to connect Cables A and C from the switch to miniature phone jacks (center wire to lug #1 and shielding to lug #2) mounted in the side of the computer case. The computer can then be connected to the tape recorder by audio cables with plugs on each end.

Tape recorder modification. The normal "ear" jack on a tape recorder provides a signal during playback for private listening and also during recording for monitoring the mike input. This signal interferes with the "mike" signal when both cables are plugged in while using the New Basic cartridge, and prevents a clear recording of the computer's output. We need an "ear" jack which receives a signal from the tape recorder only during playback, and this is available from the speaker output, since it is activated on playback but not during recording.

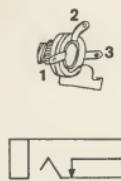

Mount a closed-circuit type miniature phone jack (like Radio Shack No. 274-253) on the tape recorder case, near the "mike" jack if possible. Again, make sure there is space inside the case for the jack to clear other components. Then wire as follows:

- (1) Unsolder either one of the two wires from the tape recorder's speaker, and connect it to lug #2 on the new phone jack (see illustration).
- (2) Connect a wire between lug #1 of the phone jack and the speaker lug which still has a wire on it.
- (3) Connect a wire between lug #3 of the phone jack and the speaker lug from which you removed wire in Step (1).

This "new ear" jack receives a signal only on playback, and turns the speaker off when the cable is plugged in. The normal operation of the recorder is not affected. Plug audio cables A and C into the tape recorder's "mike" and "new ear" jacks, and label the computer-mounted switch ":INPUT" and ":PRINT" according to how you plunged in the cables. A little red paint on the "mike" cable will remind you which cable is which, just like the Old Basic Interface cables.

Computer-mounted Switch

"New ear" jack in tape recorder

### Parts List:

2 Extension cables (mini plug to mini plug)	Radio Shack No. 42-2420	\$2.29 each
3 Mini phone jacks (closed-circuit type)	Radio Shack No. 274-253	\$1.39 for 3
1 DPDT mini switch	Radio Shack No. 275-614	\$2.19
Plus a little wire and solder.

SAFETY MESSAGES are presented to McCormick & Co. employees in the Baltimore plant of the spice-producing corporation by means of a Bally Arcade. Subscriber Lou Gubernatis programs his Arcade with applicable safety messages and encloses them in an attention-getting visual display which is then placed on the cafeteria television screens by means of video tape. The company is quite enthused over the increased effectiveness of Lou's approach.

MICRO MEMORY EXPANSION is illustrated below. This schematic will enable you to add 1K of static RAM to the Arcade, courtesy of Mark Keller. This is probably the limit of addition that can be supported by the existing power supply.

6000 - 63FF

PRINTED MATERIAL that has been obtained over the last three years is listed below. Copies are available at the costs indicated, postpaid. Some of our more technically oriented subscribers have been successful in digging into the hidden areas of the Bally system, and have agreed to share their findings with us.

- o EXECUTIVE SOFTWARE; or a listing of the ROM cartridge, as disassembled by Tom Wood. Part of the document lists the ROM subroutines that are executed by an RST 3BH instruction, while the second part contains the listings from 0090-1FFF 27 pages, \$3.00
- o BASIC CARTRIDGE LISTINGS - The Tiny Basic cartridges taken apart by Tom Wood : the Bally Basic listing is 63 pages, \$7.00; while the AstrVisiob Basic is 70 pages, \$7.50 Operating instruction (not the Manual that comes with the cartridge) \$2.50
- o BALCHECK A program was developed by the Bally software engineers which 'looked at' the operation of the printed circuit board and determined if all was well, or it would identify the problem area. The program was entered into a 2716 chip, and a couple of 7-segment LED drivers and LEDs added to make up a package. All boards were inspected by this machine prior to insertion into the box. Tom Wood ran this through his disassembler and provided us with the listing, while I have added the sparse instructions. 60 pages, \$7.00 (NOTE - Dick Belton 301-488-2806 can provide either the ROM cartridge or complete unit.)

The advertisement features a central sunburst graphic containing the text: "STEREO COLOR ORGAN, LIGHT SHOW ON YOUR TV, INTERFACE WITH BALLY". Below this, another sunburst graphic contains the text: "OPTO ISOLATED ALL COLORS BRILLIANT DISPLAY". To the left of the top sunburst, the text "Color Organ/Light Show: Interface Bally Astrovision to any Stereo Speakers, creating New Visual / Musical Forms." is written. Below this, the text "Interface unit with Cassette Demo. and instructions \$39.95.. Implement your own creative ability!! The Light Show has a Money Back Guaranty." is displayed. At the bottom, the text "We have 24 games on Cassette for Bally Astrovision to choose from on either of the Basic formats." is followed by "Write for our new fall 81 catalog It's illustrated and FREE!!!".  
At the very bottom, there is a stylized logo consisting of two interlocking 'M' shapes, with the word "SOFTWARE" above the right one, and the address "8599 FRAMEWOOD DR NEWBURGH IN 47630" below it.

EXTENDED MEMORY is mentioned a number of times, and will be even more so as time goes by. Two major problems exist with the Arcade - the lack of a full size keyboard, and the extremely small memory (1.8K). Some very clever programming has taken place over the last three years to work around the memory problem, but there is no substitute for memory space. To alleviate this, Perkins Engineering brought out the Blue Ram 4K memory addition, which is housed in a small blue box that attaches directly to the 50-pin expansion connector at the back of the Arcade (snap out the segment between the two inner hand controller ports). In addition, a keyboard can be attached to the Blue Ram to overcome the other shortcoming. A second company, Alternative Engineering, is also providing a memory addition on a larger scale, with a 16K RAM in a relatively large box that allows for future additions. It too has an attachable keyboard. Each of these vendors also makes available a new language for the Arcade, generically called "Extended Basic". This language is essentially identical between the two vendors so that programs written on one system will operate on the other. There are some operational differences, the Blue Ram version is provided on a ROM cartridge while the Alternative Engineering version is on a tape. We will be supporting this language with programs, tutorials, etc., as we do the two Tiny Basics. Both vendors frequently advertise in the ARCadian,

This is one of the VIPER programs that demonstrates Extended Basic. Those of you with the Blue Ram Extended Basic can get a colorful display with this...

NUCLEAR MATH additions were sent in by Don Gladden, to supply the constants that are needed. After loading the program, type in the following without using a line number:

C=30;M=20;O=34;P=28;R=29;V=470;W=32;Y=1000

Then run the program. Now, since the caonstants above are not part of the program listing, they won't print out if you use LIST or PRINT. If you want to save this program on tape, you will have to also load the constants. To do this, type in

```
:PRINT;NT=1;LIST;PRINT"C=30;M=20;O=34;P=28;R=29;V=470;W=32;Y=1000;
:RETURN;RUN
```

and then press GO to get the program listed to tape.

STARFIGHTER sets the screen up as a viewport to space, where an even dozen alien ships are waiting for you. You will see a set of crosshairs, and then an alien ship will appear. Move the joystick in the direction of the ship to line up the ship in the sight. Pull the trigger to fire. You can only get a hit if the ship is in dead center (not easy at all). You are in trouble if your shields get to 0%, or the temperature goes up to 100.

W & W Software Sales new address: 355 South Main St., Marine City, MI 48039

FOR SALE: Bally Arcade with 2 hand controllers, Bally Basic, and 11 videocades. Asking \$300. Terry Daly, 3048 So. Poplar, Chicago, IL 60608

ADD-UNDER NEWS - Late word has it that printed circuit board design is now undergoing verification, and then a small number of boards will be "stuffed" with parts and checked out. If all goes well, then production will get under way. Early 1982 still looks like a good date for this long-awaited hardware.

CONSUMER ELECTRONIC SHOW, that semi-annual get-together, is two weeks away. Dick Hauser and I will be at Las Vegas to see all the new and marvelous things the Electronics Industries have for us to buy. We'll be at the AstroVision booth to get acquainted and re-acquainted with dealers, distributors, buyers, etc., and the AstroVision team. Full report next time.

INCENTIVE While we'll be talking to top level people in the distributing chain, it may be a while before the information trickles down to the individual retailer and his sales personnel. So I'd like to enlist your support in spearheading an attack on the working troops - make them aware of: 1) the ARCADIAN; 2) the existence of the Basic cartridge and what it can do; and 3) the existence of our advertisers and their products. Accordingly, we are making up a little package of this data and would like you to give copies to any retailers in your area. This data will be coded, and when the retailer contacts us, we'll send you a buck for your trouble. The package will be completed when we get back from Las Vegas.

NEW USER GROUP is forming up in the Eastern part of Cleveland. Contact Jack Walters, 630 Broadway Ave., Bedford, OH 44146 (439-2542) for details as to meeting dates, etc. The place will be his store (Visual Aides), which will be a fully stocked Arcade dealer, including third-party programs on tape from our advertisers (and possibly others - are there any?).

CONTEST STORY: There was no contest last month because there were no entries. The story is a little different this time - lack of time. I had to rush this into print because the printer was taking the week off for the holidays, and there wasn't enough time to get the tapes to the judges. The contest will be back next month - but entries are always needed. And we need 'regular' programs as well.

#### MACHINE CODE

The advent of the Bit Fiddler's cartridge (check the ad on p.26 and the review) now allows us to bypass the Basic cartridge entirely and to communicate directly with the Z-80 microprocessor. Previously, we had to utilize some of the hidden (unpublished) features of the Basic cartridge in order to access the Z-80 to use machine code. The first of a number of articles about our success in so doing will be found in Volume 1, page 25. Subsequent articles and programs brought us to the point in the last Volume where we could generate characters, and where the computer was doing most of the work of entering the code.

Now by replacing the Basic cartridge with the Bit Fiddler's product, we no longer have to use "work-around" techniques.

The Z-80 microprocessor operates by means of a set of instructions that tell it what to do in a highly defined way. These directions are supplied by the chip manufacturer in a document called the "Z-80 Instruction Set". We would also need to understand the principles of machine code operation in order to utilize the instructions properly. We plan to provide some introductory material in these pages for those interested in this subject.

## TUTORIAL

MAGIC REGISTER by Brett Bilbrey

The Bally Arcade has a very powerful graphics register that not very many people know about, or know how to use. Let's find out what it is, where it is, what it does, and mostly, how we can use it. But first its name: MAGIC REGISTER

The Magic Register is a hardware register (storage space) that exists in the custom chips. It is port addressable, which means it is accessed by the &(X)-Y construct from Basic, or the OUT command from machine language. It is classified as an output port which means that values may only be sent to it, never received from it. It has been assigned the value of 12decimal, or 0Chex.

I hope to show in the following text and examples how you can make use of it. But first lets start with its principle of operation. The Magic system is enabled (set into operation) when data is written to a memory location (X) between 0 and 16383dec. or 0 to 3FFFhex. Since the first half of this area is the ROM operating system and the second half is reserved for the ROM game cartridges, we cannot write data to this area. If we try to write to this area, the Magic system knows to add 16384 to our location (X), and instead write to the new location (X+16384) the data modified by the contents of the Magic Register. The type of modification done is determined by the bits that are set in the Magic Register. The bits are assigned as follows:

- |       |                                       |
|-------|---------------------------------------|
| Bit 0 | Least significant bit of shift amount |
| 1     | Most significant bit of shift amount  |
| 2     | Rotate (not supported by our Arcade)  |
| 3     | Expand                                |
| 4     | OR                                    |
| 5     | XOR                                   |
| 6     | Flop                                  |
| 7     | Not used                              |

The order in which Magic functions are performed is as follows:

Expansion is done first, then Rotation or Shifting, then Flopping, and lastly OR or XOR. As many as four functions can be used at any one time, and any function can be bypassed. Rotate and Shift as well as OR and XOR can not be done at the same time.

Next I will give a quick explanation of the Magic functions. For a more detailed explanation I refer you to the Operating System Manual.\*\* When using the shifter, the data will be shifted 1,2, or 3 pixels to the right, depending on the value of bits 0 and 1 of the Magic Register. Rotate can only be performed by the commercial version of the Arcade. Expand takes the 8 bits of data to be written and expands it to 16 bits by making a 0 bit into a pixel defined by bits 0 and 1 of the expand register, and a 1 bit into a pixel defined by bits 2 and 3 of the expand register. When using the expand option, it is necessary to prepare the expand register (output port 19hex or 25dec) to determine in what way a bit will be expanded into a pixel. This is useful for storing a two-color pattern in one-half the normally required memory space. The OR and XOR functions will first read the memory location (X+16384), then OR or XOR the data that we want to write there with the data that was already there, and then store the result in the location (X+16384). Flop exchanges pixel 0 with pixel 3, and pixel 1 with pixel 2.

Now that we know what the Magic Register can do, let's try an example. Since the Magic Register is a hardware register, it is usable with both machine language and Basic. To make the example simpler, we will do it in Basic.

For our we will use the XOR function. I will leave the other functions for you to experiment with on your own.

What can we do with XOR? Well, if you have graphics on the screen and you want to place another pattern on the screen without erasing the existing graphics, you can do this by using the XOR function when you write the second pattern to the screen. (Examples of this would be the players moving on the field in baseball, or the galaxians moving over the stars without erasing them.)

By writing the second graphic to the screen again in the same place using the XOR function, we now 'erase' our second pattern and leave the screen like we started. So lets set up our example to see this happen. First we set the screen parameters and put a box on the screen. This is our 'original' pattern. Then we set the Magic Register for XOR (MAGIC = 00100000) which is 20hex or 32dec. Then we will POKE some values to the screen to write our second pattern. (NOTE: using the PRINT, BOX, or LINE command in Basic will clear the Magic Register, this is why we must POKE the second pattern.) Now we see a small pattern in the box and if we POKE the same second pattern to the same place using the XOR function, we will erase our small pattern and leave the box as when we started.

The first program example will POKE, then erase, our small pattern over and over (pressing any key will cause the pattern to appear and disappear as the key is repeatedly pressed.) the second program will jump with the pattern across the screen without messing up what was there to start with. Hopefully this tutorial will help you to understand a bit (pun intended) more about what the Magic Register is and what it can do.

\*\*This document, also known as The Manual of Hardware and Software, was written by the Bally software design engineering team of Dave Nutting Associates. It covers subroutines, machine operations, and details of the interior workings, plus some specifications of the custom chips. The second half includes disassembled listings for virtually everything. Two points - it talks to the commercial version at times, and just how applicable it is to the current production is not known. Over 300 pages, it is available from the ARCADIAN at \$35, postpaid.

# ARCADIAN

This chart (taken from the Manual referenced on page 25) shows the allocation of memory, and illustrates the location called Magic Register.

## Z-80 MACHINE LANGUAGE?

That's right! A NEW cartridge for programming the BALLY ARCADE entirely in Machine Language. Now you can have:

- Fast graphics--Better animation
- 4 colors instead of 2
- More efficient memory usage
- The capability to produce Cartridge Quality program tapes\*
- Easier access to all on-board subroutines
- Complete control over all facets of the BALLY ARCADE

All this and **MORE** with the

Machine  
Language  
Manager  
for the  
Bally® Arcade

**\$54.95†**

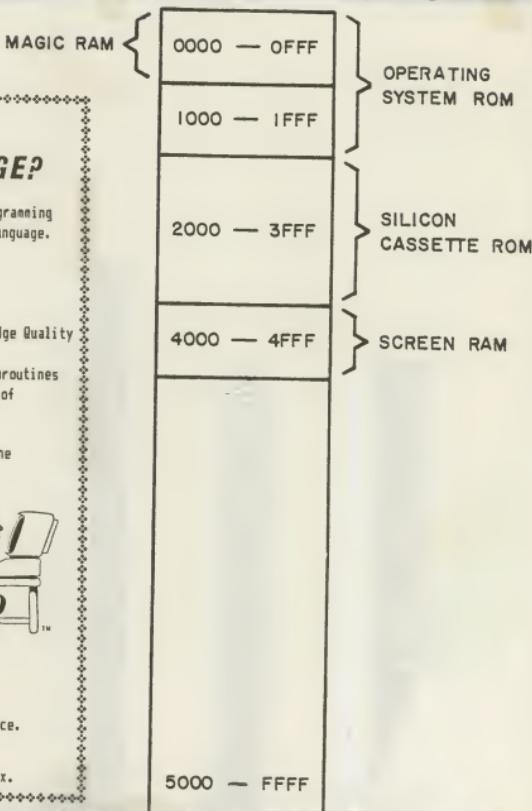

From

The Bit Fiddlers  
P.O. Box 11023  
San Diego, CA 92111-0010

\*Cassette requires 300 Baud interface.

† Includes postage & handling.

Calif. residents add 6% sales tax.

W & W Software have temporarily closed down, primarily due to a printer problem, plus the recent move. We'll let you know when they are up and running again.

GREEN SHEET error. Those of you new subscribers who have copies of the green program listings may find a difficult-to-read segment in line 233 of page 4. The second box command should read, BOX 34,4,12,9,L

BALLY BACK? The Dorfman article reprinted last time mentioned a Bally return to consumer games - well, so far, they have licensed PacMan to Atari for their machine, and they have licensed Commodore to manufacture some games for the VIC-20.

COLUMNS is a computerized version of an old card trick. The computer will randomly select 21 cards (no face cards are used) and shuffle them. They are then laid out in 3 columns containing 7 cards each. You pick any card from the layout, then when the computer asks /WHICH COLUMN/ type in the column which contains your card (1-3 from left to right). The computer will then pick up the cards vertically, by column, and deal them out horizontally, which will rearrange the order. Tell the computer which column your card is in now. The computer will pick them up again vertically and lay them out horizontally, then ask you for the column once more. The computer will tell you the name of your card!

Examples of card names:

3C = 3 of clubs	5H = 5 of hearts	7S = 7 of spades	9D = 9 of diamonds
-----------------	------------------	------------------	--------------------

# ARCADIAN

## MACHINE LANGUAGE MANAGER, a review...

We carried an ad for The Bit Fiddlers in the last issue, which offered a new cartridge to be used in the Arcade. I ordered one, and quickly received a package containing the cartridge, a manual, and an overlay card. I asked Al Rathmell to review the product, and his report follows:

"The Machine Language Manager from the Bit Fiddlers is an EPROM plug-in software package for Z-80 machine language program development on the Bally Arcade.

"The user's manual is excellent. There are nine chapters that in a concise and easy-to-understand way, cover the concepts of machine language programming, use of the manager and its utility routines, and some good sample programs.

"The manual also includes a complete source listing of the Machine Language Manager, as well as the Z-80 instruction set in alphabetical order. The users manual is great, and one of the best features of the Machine Language Manager!

"Using the Manager is easy. After reading the users manual once, all that is required is an occasional glance at the quick reference command list on p. B-1.

"The first obvious difference from using Bally Basic is the small character font. The small font allows up to 15 lines, and 39 characters per line. At first it looks a little strange, especially N and Q, but it is certainly readable and allows about twice as much information to be displayed than Basic. Punching in machine code is simple if you don't make mistakes. Fixing mistakes is a little tedious since the address is shown only every eight bytes. The insert and delete are somewhat difficult to use because you must keep track of the address of the last program opcode.

"The reset function is like the HALT command in Basic. Pushing RESET returns control to the manager without changing memory. Memory is only cleared during power-up.

"The Machine Language Manager is a useful tool for those into machine language programming. Some future additions that would make it better include a search function that would scan a memory range for a specified byte or string of bytes, and an assembly function that would generate opcodes from mnemonic source codes."

The above was written by one who uses machine code programming frequently, not a new-comer. I noted that the text contains some educational material, and some leading-by-the-hand, which is just what I need. As with most computer operations, one needs to "do it yourself" to better understand the operation, and I will be doing so in the future. You will be hearing more about the Machine Language Manager as we utilize this opportunity to study the computer in more detail.

A review of the manual that comes with the cartridge reveals a few interesting details. The first 37 pages contains a mixed bag of general descriptive material, some insights into the Basic language as written by the Bally software team, specific data about the Manager, and instructions as to its operation. There are a few sample programs.

A shift key is included, so that a couple of keys do double duty. These primarily are associated with the use of the tape port (300 baud, requiring the cassette interface), so that the equivalent of Basic commands, :PRINT, \*PRINT, :INPUT, and :LIST can be generated.

Following the above, the Bit Fiddlers have included the disassembled Manager program (28 pages), and the Z-80 OpCode in 15 pages.

January 22, 1982

CES IS OVER and I had an enjoyable but tiring four days. Also attending were: Andy Guevara of The Bit Fiddlers; Dick Houser of The Source Book; George Moses of George Moses Co.; John Perkins of Perkins Engineering; and Mike Toth & Marion Nalepa of Spectre Systems.

We all worked to help the AstroVision personnel show off the Arcade, the new game cartridges, and point out the features of the new Basic. We also met a number of subscribers and a few old acquaintances.

AstroVision had a good-sized booth, with 9 machines mounted on pedestals, each having a tv mounted above for good visibility, plus a giant tv console for really showing up the details of the game cartridges, and then two more tv's dedicated to the Add-Under. These were staffed by ZsuZsa Molnar and Frank Dietrich. Various AstroVision personnel and the distributors spent their time selling the product. For those visitors showing technical interest, we showed the Blue Ram, the Viper System 1 memory board, and the Bit Fiddler cartridge. We also had the Roger Saunders Edge Labels for display.

GAME STATUS will be indicated here, a more descriptive article will be presented next time.

Now available: Grand Prix, Galactic Invasion, Space Fortress, and Biorythm. Coming up soon will be Pirate's Chase, MusicMaker, and The Wizard. After these will be Cosmic Raider and Coloring Book. There is a candidate for PacMan and it will be ready when some non-technical problems are ironed out.

Samples of everything except PacMan and Biorythm were shown. Two future candidates are Quest for the Orb, and SolarQuest.

THE ADD- UNDER units were very popular. While a number of programs were "canned", that is, they were on disc, both ZsuZsa and Frank made up little displays on the spot, and showed how the machine's ZGrass language could access the "macros" (large scale sub-routines) and show parts of pictures, reverse pictures, and rotated pictures. The most interesting item was a facial figure, made up of three subroutines - one for each eye and one for the mouth - each of which had a motion routine (each eye could be open, closed, look left, straight, or right, for example.) By some simple commands, the eye would then wink or look around. This was coupled to the Votrax sound synthesizer, so that the mouth movements followed the preprogrammed vocal phrases. While these units had two disc drives associated with each of them, the production units will not. The internals will be compatible with the addition of a disc operating system, which will be an optional accessory.

The current status of the Add-Under places it in the hands of the FCC next month for approval. Then production can get under way and deliveries should be in the 90-120 day region. If you are interested in the Add-Under, whose price is currently holding at the \$600 level, let me know. There is a good possibility that we may have one of the samples on display at the West Coast Computer Faire, here in San Francisco, this March. More on that next time.

THIRD-PARTY SOFTWARE, that is, material developed by parties outside the AstroVision design and development organization, is in demand by everyone. If you are interested in writing software for the Arcade, of marketable quality, please contact me for details. Those who advertise in the ARCADIAN will be receiving a separate letter from me about this.

CONTEST ENTRIES THIS ISSUE are the programs\* Cube, Pro-Bowl, and Alien.

BIT FIDDLER REVIEW - 2. In this issue we provide another review of the new cartridge by the Bit Fiddler, this time by Tom Wood.

#### Machine Language Monitor program

Ever wished for really fast graphics or control of the screen for full use of the 256 color capability? As I'm sure you guessed, these feats require the use of machine language (or perhaps the add-under when....) and machine language and BASIC just don't make a good couple. The Bally Arcade has long needed a well thought out monitor program; one that would permit a decent range of memory manipulation, cassette tape input/output, memory dump and program breakpoint facilities. This monitor would, preferably, be relatively inexpensive, utilize the game cassette connector and the built-in keypad. This would mean displacing BASIC, but since we have already committed to machine language, BASIC is of no further use.

#### Prayers are answered

The Bit Fiddlers have been listening and have recently introduced a very professional package which does all this and more. The Machine Language Monitor (MLM) is provided in its very own game-type cassette, complete with new keypad overlay and manual consisting of approximately 96 pages. Very unusual about this package is that 28 pages of this manual are the assembly listing for MLM itself. This listing is provided so that users may use any of the MLM routines instead of re-inventing the wheel.

Although I was able to use MLM for only a few hours, I was able to confirm that it performs to the manufacturers claims. It is also evident that it opens up a whole new set of sophisticated possibilities from other ARCADIANS who have already proven themselves to be an extremely resourceful lot. Using MLM, all of the Arcade facilities are available to your program including light-pen and screen interrupts, all 256 colors, direct control of the MAGIC register, full use of the 3-voice sound generator, the expansion port, game connectors etc.

About the only restriction I see is that the basic Arcade just doesn't contain much memory. MLM permits maximum use of the space that is available, allowing you to trade off viewable screen area for more program area. This feature provides 140 Hex (320 decimal) bytes and use of most of the screen, or more program bytes as you decrease viewable screen area. This space and use of MLM routines will permit reasonably sophisticated programs to be run, but as your desires and expertise increase, your need for additional memory will also increase. Luckily, MLM is compatible with any of the expansion facilities currently available.

The facilities provided by MLM are requested via the keypad layout illustrated here. In general, hex numbers are entered first followed by a key informing MLM what the hex data is to mean. Thus to enter address 123E hex, simply key in 1, 2, 3, E, ADDR. Since no more than 4 digits are being entered at once, MLM provides no backspacing or correction capabilities as such. Instead, just keep entering data until the last 4 (or 2) digits entered are correct. Complicated to explain, easy to use.

D	E	F	CALL
A	B	C	REG
7	8	9	LIST
4	5	6	INS
1	2	3	READ
*	0		WRITE ADDR.

# ARCADIAN

This monitor includes a feature that is both useful and dangerous, that of the INS key. With it data in memory is moved up to make room for new data (or, using \*INS, moved down to delete extra data) thus saving a lot of keystrokes when inserting forgotten opcodes. One must remember, however, that internal program addresses will also change. This is no problem for relative jumps, but absolute jumps and calls can become disasters for the unwary.

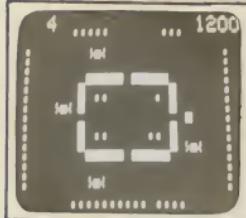

The asterisk (\*) key serves as a "shift" key for certain command keys. Thus, \*WRITE means output to tape, \*READ is tape input, \*INS is delete, \*LIST is print and \*REG is tape list without load.

I wish I had the room to go into further details about MLM, but that isn't possible here. If your appetite is whetted it is justified. Any "hacker" needs MLM. It is worth the investment and will permit you to enjoy the programs written using it in the future. Now, anyone working on an assembler???

A final word on this package. We will be supporting the use of machine language programs in the ARCADIAN, and solicit your inputs. Here is another way to increase your knowledge of computers in general and the arcade specifically.

ASTRO- is now the official name for the various items - all new production hardware will have "Astro-" instead of the prior "Bally-" title.

## TWO NEW GAMES IN BALLY BASIC

### Quadron

Prevent waves of monsters from breaking through your energy fortress.

Pilot your ship through two columns of missile-firing aliens

### SPACE GAUNTLET

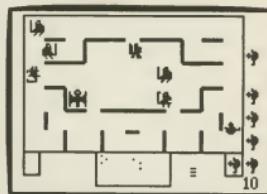

Both games on one cassette \$9.50

Order Tape #100

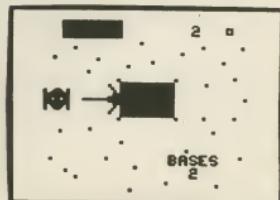

Please specify  
Bally or Astro.  
Basic

The tiny arcade  
F.O. Box 1043  
Cuyahoga Falls, OH.  
44223

These sketches illustrate the screens of two of the new AstroVision games.

THE WIZARD

SPACE FORTRESS

ASTRO-BASIC MANUAL CORRECTION There is a direct typo in the program "Artillery Duel" on page 95. In line 430, where BC is controlled, the printer dropped the initial "R" in the Random command, so change the printed portion to read BC=RND(3)\*13+85 Then in line 190, when entering this line, be certain to leave a space after the IF statement. The printed line overflow to the next line has caused some confusion. This portion of the line should look like this:

```
IF W TV=95+(W>0)*2
```

#### SOME INTERESTING INFORMATION gleaned from the news releases presented by AstroVision management at the CES.

We have all complained about the lack of product, and the lack of advertising. These shortcomings are about to disappear --

Production capability is planned to triple this year. In addition to the existing facility in Garner, IA, the new plant in Sacramento, CA is expected to be on-line in February, and negotiations are underway for a third location in the Lancaster, PA area. With these plants up and running, plus other sub-contract locations, the capacity would be in excess of one-half million Arcades, 5 million cartridges, and 5,000 ZGrass units per year.

The Las Vegas area was saturated with a tv commercial during the 5 days of the show. Astrovision's advertising agency had made up a 30 second commercial showing some of the new cartridges, and this was shown 121 times - a full hour of time. This was the kickoff of the 1982 campaign, which will see an expenditure of \$10 million dollars in tv advertising. This same commercial will now be sent to 50 major market areas, so keep an eye out for it.

#### GAME INSTRUCTIONS

**The Cube:** The diagram on the screen shows the cube 'unwrapped', with the front to the left. You must mix the puzzle up yourself - the computer acts only as a recorder of your moves. Moves are always made clockwise. Use the keypad to enter the moves. To rotate section 1 by one turn clockwise, you would input 11. The computer will then rearrange the cube to match your directions.

**Cryptologic:** This is a two-player game that can also be played by teams, rotating turns at guessing. When the screen asks, enter the number of letters in your word(s). (From 6 to 20) Spaces count as letters. While your opponents face the other way, enter your word(s) using the keypad. If you make an error, you must restart the game (press HALT, then WORDS RUN GO). After checking for errors, press GO. The entry will be erased, and then scrambled, using a random scrambling technique. The 'other side' must rearrange the letters/spaces into the proper relationship using a minimum number of moves.

**Alien:** The computer gives you 100 seconds of time to get a high score. The game stops at that time, or if you run out of bullets earlier. Hitting the Alien nets you 5 points, hitting the wall at the top of the screen yields 3 points. Once in a while there is a 'bonus' period when hitting the alien will increase your score by the bonus amount. When the screen buzzes, the Alien's spy satellite is whizzing by. A hit on it is worth 100 points, but it is very difficult. Use the joystick knob to move your gun laterally across the bottom of the screen, and the trigger to fire directly upward.

**Pro-Bowl:** Use the chart below to enter your plays - the Offense uses Joystick (1) for its inputs (see the sketch), while the Defense uses the keypad. The arrow on the screen indicates ball direction. The game includes fumbles, touchdowns, field goals, safeties, and a two minute warning. Breakaways are possible on running plays, and incompletes and interceptions possible on passing plays.

ALTERNATIVE ENGINEERING REPORTS that all Viper 1 units which have been paid for have been shipped. It has taken a while, but they are now 'ahead of the game', and they can deliver from stock. The keyboard will be ready soon - I have an evaluation unit here, and can say that the quality of this unit is equal to the Viper itself. An eight-foot retractile cord connects it to the Viper 1, making it quite convenient to place in your lap while operating. More later on it. If you have questions or would like a copy of their brochure, call or write Alternative Engineering Inc., P O Box 128, Gardiner, ME 04345 (207) 582-6327

(In this photo, the arcade unit is sitting on top of the new Viper 1 box, while the keyboard is in front. The Viper box is resting on some unseen supports - the keyboard is only 9" deep.)

TRADE: I HAVE EXCESS #5002 CARTRIDGES AVAILABLE FOR TRADE,  
(POKER/ACEY DEUCEY/BLACK JACK). I NEED #2005 STAR BATTLE,  
#2010 DOGPATCH, #2011 GALACTIC INVASION, #2014 GRAND PRIX,  
AND THE DEALER DEMO CARTRIDGE. WRITE BEFORE SHIPPING TO:  
JAMES E. NOLL, P.O.BOX 16392, IRVINE, CA 92713

TAPES NOW AVAILABLE:

G1 "Haunted House" (Bally Basic only) Nine separate programs are used in this game! An adventure game with corny jokes!

"Guess Five" - a 'Mastermind' type game - addictive!

G2 "Quickdraw"-beat the Bally or another player to the draw!

"Skunk" - based on the popular dice game. 1-4 players

Either tape \$8.95 pp. Please specify if you have new (AstroVision) basic  
Don Giadden, 59400 Nine Mile, South Lyon, MI 48178 313-437-3984

All software sales by Rich Tietjens and/or R&D Enterprises International are indefinitely suspended due to military postal regulations. Anyone with unfilled orders may send a stamped, self addressed envelope and a photocopy of your cancelled check to receive a refund. Address all correspondence to Rich Tietjens, PSC Box 542, APO Miami 34004. Mail for R&D Enterprises will not be delivered by the post office.

Permit No. 931

WHAT'S NEW? Well, nothing definite, but there are rumors around. These are cropping up: The Add-Under has lost its voice but gained 64K of memory, and a new title - ZGRASS 100; The Arcade unit will now be called the ASTROCADE; The pacman derivative will be out the first of July; And that there will be a Videocade of John Perkins' ARTILLERY DUEL, with all the graphics, color, and sound available in a cartridge, plus a little humor.

GREMLINS TO THE LEFT OF US... Yes, there were a couple of errors in the last issue.

FUDD will not work with the new AstroBasic. There is a discussion under "DIFFERENCES", below.

page 46- The first of the Poke'd values should read 1779 instead of 1799.

page 52/53- Line 960 should read 1000, and change the HOHO segment of line 8002 to read

HO0H0H0ONOLL0HH0FH000

In addition, Ken Springsteen suggests the following changes to his program on page 42:

add a new line 270 PRINT; PRINT; CX=-60; FOR B=K+1 TO Kc2  
change line 510 to read:

:PRINT; LIST 1,13; GOSUB 550; LIST 100,14; GOSUB 550; LIST 285,8; GOSUB 550; LIST 349,9; GOSUB 550; LIST 425,7; PRINT "CLEAR; RUN  
to load the program to tape (in Bally Basic), key in GOTO 500  
start the recorder (RECORD), and press GO

DIFFERENCES between the old and new Basic Videocades: We are somewhat at a disadvantage by being outside the company because what we know of the Basic, beside that which is written in the small manuals, is primarily discovered material. That is, no one tells us all about the secrets, or tricks, or capabilities, and one or another of us has to find these out through research or luck. We were fortunate in receiving an unofficial set of brief notes that discusses these differences, much as the Bally Basic Hacker's Guide.

- The old Basic has a \$ command which accesses the calculator routine resident in the on-board ROM. With this command, one could perform arithmetical calculations with 6 places either side of the decimal point. Not a very popular command, it was removed to make way for some of the useful features of the new system. Programs written using the \$ command are not convertible for use with the new Basic. Unfortunately, this leaves out a couple of clever programs.

- :Return will not be understood by the new system, but it can usually just be forgotten from a program. It's purpose was to close off the tape input port.

- &(16) through &(23) commands controlled the variables of the noise system. These have been replaced as follows: old commands - &(16), &(17), &(18), &(19), &(20), &(21), &(22), &(23) are replaced by MO, TA, TB, TC, UD, UC, VR-UF, VA, VB, NM, NU commands, respectively. If your Bally Basic program contains the &( ) notation, set NT=-1 to disable the sound, and experiment.

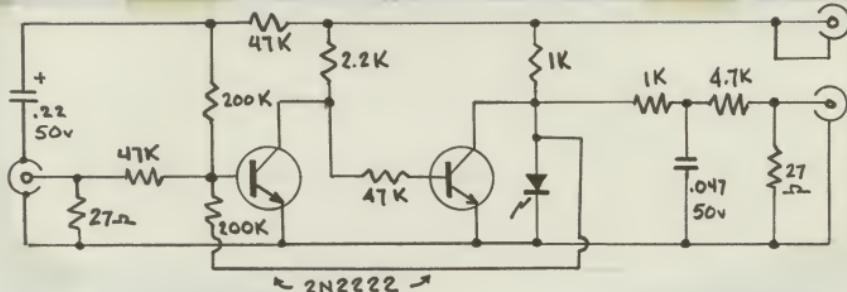

- SM series are commands only in AstroBasic, having to do with where/how screen printing appears. The old Basic has the equivalent of SM=0. SM is used for effect, and its elimination would not ruin a program (usually).

- Machine code problems which is the case of FUDD. Machine code is inserted into memory spaces ("poke'd") using the %( ) command. The location of this memory space is the Line Input Buffer, which now occupies a different location in the memory map, from 20180 - 20283 in the old Basic, to 20154 - 20257 in the new Basic.

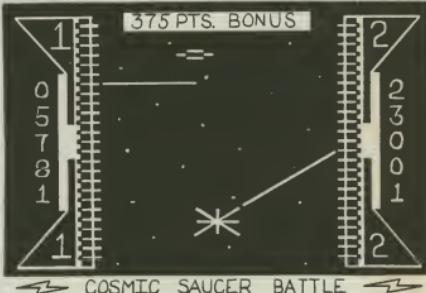

- \*() is a new string system that is only available in the AstroBasic. A program with both string systems is not convertible to Bally Basic, one with only the \*() might convert.

**ARCADIAN**

TAPE DUPLICATION 2      Perkins Engineering sent this circuit which is to be used between two inexpensive recorders for the duplication of tapes. The LED should be a 'bright' one, such as a suggested RShack 276-033, and if you can measure the transistors, the one with the lower gain is at the left.

Flying saucer invaders are bent on conquering the Earth. Star Fleet Command has given you and your co-pilot the task of halting their advances. Can you stop the saucers and their missiles in time? The fastest joy stick game ever produced for Basic. 1 or 2 plyrs. Excellent color, sound & bonus score. Cosmic Saucer Battle and The Black Lagoon, both for \$12.95 on #2 cassette.

Call in your order, COD or Master Card, and deduct \$1.00 from the total.

**SOFTWARE**

8599 Framewood Drive  
Newburgh, IN 47630

TAPE DUPLICATION 3 Wavemakers is making custom duplication available. The cost is \$1.50 per cassette (C-12), including cost of the cassette, with a 50 piece minimum order. Contact them at 312- 893- 4192.

GOLDFISH is a program that was developed by Andy Guevara by the use of his Machine Language Monitor program. He displayed it to us at the Faire and it is a cute demonstration piece. A fishtank appears, a number of fish swim back and forth - continuous motion, no jerks - and a little pussy cat looks longingly. A clock is included, and every minute, the cat meows. Andy has the listings for \$3., and a tape that can be loaded into either Basic (:RUN), or the MLM cartridge, at \$5. Check the address in their full page ad.

ELECTRONIC GAMES, May issue (released March 15!) has numerous mentions of Bally/Astrovision. The magazine is primarily directed towards company-produced games, either for full-size arcade units, or for home game units such as Atari,etc. A two-page article includes an interview with Bob Ogdon, programmer for Dave Nutting Associates, outlining some of the games he produced. An interesting magazine if you want the 'big picture' of the game universe.

SCHEDULE FOR PUBLICATION- for the remainder of the year is currently planned as follows: The last day for me to receive material to be included in the next issue is essentially the last Friday of the month, specifically: April 23, May 28, Jun 25, Jul 23, Aug 27, Sep 24. The issue should then be in the mails the following Friday. The cutoff date for any programs submitted for the contest is the Friday prior to ones identified above. If anyone plans on a full- or half-page ad, I'd like to know about it early, so as to block out the space. Your continued cooperation in sending in programs and text material will help me keep pumping the paper out for our mutual enjoyment and learning.

VIDEOCADES AT CLOSE-OUT PRICES: these are left-overs from the West Coast Computer Faire, and I'd rather not be in the mail order business. Galactic Invasion, Bally Pin, Space Fortress, Astro Battle - at \$25. each including shipping. New Basic at \$46. including shipping. We also have a real 'deal' on the old Basic at \$21. including shipping. These prices are good until April 30.

```

CARTRIDGE SWAPPING - 2: continuing Dave Ibach's scheme with some explanation -

- o The routine is "relocatable", meaning that if you already have something residing in location 19900, you can change the address.
- o Once the routine has been entered, do not allow scrolling, or it will be destroyed.
- o For a shorter delay loop, (about 10 sec.) change 8480 to 8464.
- o Only the program and other occupants of the screen are (string variables) are preserved. Contents of the variables (A, B, etc., and RM, FC, etc., are unpredictable. SZ Will be correct, however
- o If you want to erase the routine after the swap, POKE in values of zero, as: FOR N=19900 TO 19915; ZX=0; NEXT N

This is the machine language routine, with comments:

```

F3          DI      ; disable interrupts

TOP 5 TODAY by Steve Walters

This program keeps track of the 5 best scores of the day, and displays them with 3 initials selected by the player making one of the 5 best scores, just like in the commercial arcade games. It can be added to any game which involves competition for best score.

The first listing uses the keypad to minimize memory space requirements. It uses 311 bytes for the program, plus 40 bytes for the string variable, for a total of 351 bytes.

```

970 Z=0; PRINT "YOUR SCORE=",S; PRINT;
  PRINT "TOP 5 TODAY:"; PRINT; FOR
  N=0 TO 19; Q=Nd4; IF Z>1 GOTO 974
972 IF RM=0 IF S>@(N+3) GOSUB 984
974 IF RM#3 TV=@(N)
976 IF RM=3 PRINT @(N)
978 NEXT N
980 IF TR(1)GOTO NNN (next game cycle)
982 GOTO 980
984 FOR Q=19 TO N+4 STEP-1; @(Q)=
  @(Q-4); NEXT Q; @(N+3)=S; Z=1
986 CY=-40; PRINT "YOUR CODE:s";
  FOR Q=0 TO 2; L=KP; TV=L; @(N+Q)=L;
  NEXT Q; PRINT "S=Y%KsN=N%"; L=KP;
  GOSUB 988; IF L#89 GOTO 986
988 CY=8-Nm2; RETURN
998 BOX 0,-40,160,7,2; CX=-80; RETURN

```

~~Note:~~ the letter O is not used as a variable; d=divided by; s=a space; m=multiplied by

If you have memory space for 393 bytes (+40 for the string), the following modification (from Line 986 on) will allow the initials to be selected by the hand control:

```

986 CY=-40; PRINT "CODE:s"; FOR Q=0
  TO 2; L=64
987 L=L+JY(1); IF L< 64 L=90
988 IF L>90 L=64
990 TV=L; IF TR(1) IF L#64 @(N+Q)=L;
  NEXT Q; GOTO 994
992 CX=CX-6; GOTO 987
994 PRINT "sTR=OKsJY=NO",
995 IF JY(1) GOSUB 998; GOTO 986
996 IF TR(1) GOSUB 998; CY=8-Nm2;
  RETURN
997 GOTO 995 (one more line)

```

998 BOX 0,-40,160,7,2; CX=-80; RETURN

This program can be modified for New Astrovision Basic to use less memory: For the keypad version, in Line 986 change GOSUB 998; to PRINT; and eliminate Line 998.

For the hand control version, in Line 995 and 996 change GOSUB 998; to PRINT; and eliminate Line 998.

You must set SM=2 for these, and you may want to change string @ to string \*.

The New Astro Basic uses 282 bytes for the keypad version and 361 bytes for the hand control version, plus 40 bytes for the string in either case.

If you want to see TOP 5 TODAY run by itself, add Line 10 and revise Line 980: 10 CY=-40; INPUT "NEXT SCORE="S; CLEAR 980 GOTO 10

Then run it. Input a score, vary the letters with JY and select them with TR.

\* \* \* \* \*

The following must be considered in making TOP 5 TODAY compatible with your program:

- (1) the program uses @(0) thru @(19) to store the scores and initials; these should all be at zero when the program is loaded each time.
- (2) variables L, N, Q and Z are used but do not retain permanent values from one game cycle to the next.
- (3) variable S is used for the current player's score from the last game.
- (4) variable RM is calculated in Line 982.
- (5) TR(1) and JY(1) result in hand control No. 1 always being functional; if you want to use 2 or more hand controls, you will have to change these to the player-number variable.
- (6) in the New Astro Basic versions, SM=2 is required.

COLOR MONITOR CIRCUIT - \$0.10: We provided a circuit in Volume One which allowed the Arcade to be connected directly to a TV monitor (bypassing the rf link). It was only good for black and white. We thought... With some clues from John Perkins and a little experimentation with 100 ohm resistors, the following simple circuit developed. The Video signal is taken from the video output line and ground, and a 300 ohm resistor shunted across as well. The rf modulator must remain connected, as the signal appears, after conversion, on the input side as well as the output side. This circuit works very well with my NEC monitor (purchased for my Apple, but now...) YOUR monitor may require a buffering circuit, and an effective one is shown:

# Machine Language Manager

## What it is:

Many of today's personal computers, and in fact many business computers, have inside them the same microprocessor as the Astrovision (Bally) Arcade—the Z-80. This is a powerful microprocessor, capable of much more than simple games and other programs presently written for the Arcade. The Machine Language Manager is a cartridge designed to take advantage of the Z-80's power by allowing the user to program the Z-80 directly in its own native language.

## What it does:

The MLM allows greater control of graphics and input/output functions than Basic does by using Z-80 machine language. Using machine code, greater program sophistication can be achieved. This means programs like word processors, business programs, device controllers, and multi-colored high speed graphics.

## How it works:

The Machine Language Manager works with the Arcade's keypad in much the same way that Basic does, but rather than entering Basic statements, the user now enters his program in Z-80 Hexadecimal code. By using the MLM, the user can create, edit, list, run, or store his machine language program on cassette tape at the push of a button.

## Why machine code:

The primary difference between Basic and machine code lies in the instruction set. Where Basic is a "high level language", Z-80 machine code is the most rudimentary (nitty-gritty) level of programming. This means a far greater number of instructions are available for use, giving the user more flexibility. For example, all the Bally game cartridges, and even Basic itself, are written in Z-80 machine language.

## What you need to work with it:

A working knowledge of Z-80 machine language (or not being afraid to learn it), will suffice. This information can be found in almost any bookstore or computer store. To work with a cassette tape deck, you will need the old Bally Basic 300 baud interface (unfortunately no longer in production).

## What it will work with:

The MLM will work with anyone's memory extension and any and all external hardware you may want to hang on the Arcade.

## What we provide:

The Machine Language Manager comes with its own keypad overlay, and a 96 page manual. The manual is written in tutorial fashion, and once completed should only be needed for occasional reference.

## How much:

The Machine Language Manager retails for \$54.95. We pay the postage. If you're in California, you get to pay the tax.

\*SFP\* Our NEW long awaited Video Game Catalog, Featuring the Bally Arcade has been released and sent out to all our customers. If you would like your copy, just drop us a line and it'll be on its way to you. Send to: SFP D-A, 1064 N. Alta Ave, Dinuba, CA 93618.

PERKINS ENGINEERING WILL BE CLOSED UNTIL MAY FIRST FOR VACATION AND FOR RESEARCH AND DEVELOPMENT OF A RETROFIT BLUE RAM EXPANSION PROJECT. WE HOPE TO OFFER BOTH A KIT AND A WIRING SERVICE TO INCREASE THE RAM TO 16K! WE ARE ALSO LOOKING AT 64K OF DYNAMIC RAM IN THE "BLUE MAX" SOMETIME IN THE FUTURE.

Must Sell - Arcade with 2 controllers, new Basic, old cassette interface, Videocades, L & M cassettes, Wavemakers cassettes, others from Arcadian, almost all Arcadian issues. Price \$300 firm...Keith Doughty R5 D-10 Newburgh, IN 47630

FREE Productive Programmers Guide to the Bally Backache Soon in print. Ten basic steps to reduce lumbar stress factors. Innovative programming. Interesting graphics. SSAE G. Huston, 3751A Mt. Vernon Pl. Lima, OH 45804

Offered to a good home - a much loved Arcade. Completely operational - includes Bally Basic, cassette interface, hand controllers, custom carrying case, Clowns, Baseball, Hockey Mark Stradinger 414-563-3452

For Sale, Arcade with four controllers, Bally Basic plus interface, Computer Ear, Blue Ram, Videocades, all Arcadian and Cursor volumes, others, all in excellent condition. \$750 value, best offer over \$475. Garry Hallquist, Box 610, 625 Pennsylvania St. Denver, CO 80203

Ballycheck to test operation of the motherboard - built/tested unit \$80. plus \$2.50 shipping. Program burnt into EPROM \$20. plus 1.50 shipping. Bally system repairs: \$30. labor charge, +\$5.50 to ship back to you, + cost of parts needed. All parts stocked for the units. Contact Dick Belton, RGB Electronics 4906 Wilshire Ave. Baltimore MD 21206 or call 301-488-2806

Volume 4 Number 7

May 7, 1982

**FORMAT CHANGES** are in the works. Actually, we are getting too many ads, and they are starting to crowd out the editorial material. Starting next month, the largest ad accepted is 1/2 page, and we will shift the text areas to this two-column format.

**BIG FIDDLER MOD** if you haven't received an update describing the use of the 2000 baud system, drop them a line.

**ADD-UNDER INTEREST** remains high and we are accumulating a list of people seriously interested in the machine. I plan to send out a sort of Bulletin to those on the list as soon as there is definite word as to availability, etc., so if you want to be included in the 'first wave', and will have the cash to back it up, drop me a line.

**TAPE LOADING DISCUSSION** As a result of a number of questions from the newer subscribers, and the discovery of an anomaly, here are a few words regarding the loading of pre-packaged program from tape into the computer.

If you have a program on a tape, the following step-by-step procedure should result in a good load. The presentation is of a column of instructions for each of the units - the computer, the cassette deck, and the screen picture. Do these in order:

A. To load computer from tape.

COMPUTER                   CASSETTE DECK  
Cable from Basic Cartridge to 'EARPHONE'

SCREEN

1. RESET

(Blue): (Words) INPUT GO

PLAY

At beginning of loading, words on screen will slowly disappear, from top to bottom.

At end of loading, cursor reappears

STOP

RUN GO

To load next program, start at Step 1.

**PRINTING** I am still looking for a scheme to be able to print from the 2000 baud cartridge. The current method uses the old Bally Basic, the Cassette Interface, and an internal tap therein to extract a TTL level signal. Those with a printer needing a 12-volt signal can utilize a booster circuit printed in Vol. 1, P. 47, or a new one-piece system using an LC140B chip. We'll have a circuit next issue.

**STAR SIEGE ERRATA** Well, I really got that one twisted. While the instructions are for Star Siege, the program is for QUADRON. The proper instructions follow:

**QUADRON**  
(One Player)

This game challenges you to defend a four-walled energy fortress by pursuing and eliminating four monsters who are slowly impinging on the walls and intent on breaking through.

If a monster breaks completely through a wall (i.e. creates a "hole" or space the width of a wall) the fortress is destroyed. You start the game with a complement of four fortresses. The game ends when all four have been destroyed.

To eliminate a monster, you must move the joystick-controlled blip (it is in the center of the four walls) in the game begins) toward the monster and "tow" it with the blip. The monster will then disappear. However, another will take its place on the same side of the wall at a distant starting point.

You will have a limited supply of energy with which to pursue the enemy. When you are running low on energy, the background color of the playfield will turn red as a warning.

This means you will soon have to return the fortress and eat one of the energy dots located inside. To eat a dot move the blip over the dot(s). Otherwise, your speed will be cut in half and it will be very difficult to keep up with the monsters.

Eventually, you will eat up the eight energy dots. To gain a new supply of these, it is necessary to eat all sixty of the bonus dots located near the four edges of the playfield. (You will also receive sixty new bonus dots) When you accomplish this, the challenge will increase as the four monsters' starting points will move slightly closer to the fortress.

In summary, then, the game action consists of eliminating monsters to protect the fortress and eating dots to ensure your energy supply.

There are three basic routes you can follow in moving about the playfield.

1. Moving around the outside perimeter of the walls.
2. Passing through the inside of the fortress via the four openings in the walls.
3. Moving off one side of the playfield and appearing on the opposite side.

Use these alone and in combination to pursue monsters and eat dots.

## SCORING

Monster.....	200 points
Bonus Dot.....	100 points
All Sixty Bonus Dots Eaten.....	800 points

## HAND CONTROL

Joystick.....	Move the stick in the direction you wish to move the blip
Trigger.....	No Function
Knob.....	No Function

The number of fortresses you have remaining is displayed in the upper left-hand part of the screen, while the current score is shown in the upper right-hand corner.

To start a new game, press any key (except "H")

# ARCADIAN

TAPE LOADING PROBLEM We have noticed a random problem in loading programs from a tape into the machine.

The screen starts to load "garbage" at the top, five or six lines of it, then the cursor reappears.

A "fix" is to immediately stop the tape, reenter the INPUT command (and GO), and PLAY the tape. The program should start loading immediately.

I don't know what the real problem is; it appears that the leading edge of the first leader tone sometimes sets the computer into thinking data is coming in, for about two seconds (when the cursor reappears). Since there is still about one second of leader tone, it is possible for the computer to catch the end of this tone and make a good load.

We are now loading our tapes with the volume control at zero, and as soon as the leader tone appears, we turn the volume control to the normal level. The leader then appears gradually to the computer, and we have not had a re-occurrence of this problem. All tapes using this gradual scheme are coded with a green dot under the "baud rate" notation on the tape.

BLUE RAM EXPANSION BREAKTHROUGH! Perkins Engineering announces a New 16K BLUE RAM and a modified 8K Extended Basic Cartridge, with three UPDATE choices for 4K Blue Ram owners. Their tentative schedule is:

During May and June they offer to:

Expand your 4K Blue Ram to 16K for \$135.95 and replace your BR extended Basic Cartridge at no extra charge!!

Ship a kit for Do-it-yourselfers at \$99.95 with cartridge swap as above

Sell you a set of plans for \$5. On or about July 1 they will begin shipping a NEW 16K BLUE RAM with printed circuit boards and a flexible link to the Arcade. Kit price \$199.95, or assembled and tested \$249.95

All other Blue Ram products and prices are unchanged at this time.

Alien Invasion and  
Alien Invasion II

3

# DIMENSION

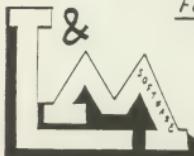

Star Fleet Command has put you at the controls of a pulse-pounding photon cannon. Your orders are to stop the invasion of aliens war machines. It takes a cool head and a steady hand. Only you stand in their way. Can Earth be saved or will the aliens destroy your cannon and invade Earth?

Normally, a picture this detailed in 3-dimension would require more memory than is available in the Arcade program section. We have utilized a special Arcade feature called mass screen memory. There is almost 4K of memory available in this way. The game operation is contained in the 1.8K program memory section. By using both in a unique way this game, with expanded graphics, is possible. It is equivalent to about 5K of memory.

This is probably the best use of the Arcade graphics to date and the largest most detailed play field yet developed for Basic.

Call in your order, COD or Master Card, and we will deduct \$1.00 from total.  
1-812-853-6895 9AM to 9PM CST - for next day shipment!

For New Basic Only

**DEFENSE FORCE**

By Robert Rosenhouse

You are the defender of your planet's energy supply. A nonviolent group of aliens in desperate need of energy sources is invading your space sector for your limited supply of fuel. These endless hordes of invaders relentlessly attempt to appropriate your supplies for their own uses. But beware, for as time passes, increasing numbers of invaders appear. Do your best to bely the onslaught of marauders.

Damage: \$10.00

Features machine language graphics  
\*\*\* Available only in \*\*\*  
\*\*\* Astro BASIC \*\*\*

Are you interested in learning machine programming? Know some BASIC? Want to do it easily on the Bally? Z-80 minicourse (45pgs.) starts from the basics and takes you thru soft techniques used with the custom chips. Analogies to BASIC instructions throughout. Experiments, charts, diagrams, explanations, and full machine code documentation on the programs included. Useful time saving utilities for machine programming. Programs include: Color Scribble and Record-Draw and record full color creations. \* Color Tunnel and Art-See over 100 moving colors. \* Color formatter-Spruce up your existing programs with this add on. \* Machine programming utility \* American Flag \* Logo \* P.S.-- You don't have to know anything about programming to use and enjoy the programs--All that is required is Old Bally Basic-- --Sorry, not compatible with Astro Basic.-- PRICE \$12.00 (Bound manual and C-20 Agfa tape w/programs.) INSTRUCTIONS

EITHER ASTROBASIC or BALLY BASIC

Stranded On Rigel 5: In this program you are stranded on Rigel 5. After you have typed in the program and all other values (see Caution) run the program. The landscape of Rigel 5 will appear and a strange noise will occur. Press any key. The computer will respond with a question mark. This is the skill level (1--easy, 2--advanced, 3--suicidal). When the computer asks you to input the code, press 5 different digits. The computer will respond with something like this: 3-2. This means that 3 numbers appear in the code and 2 numbers are in the right place. You have 8 tries at this code. This is a sample run to break the code (say the code is 62371 for example):

INPUT	CODE	
12345	3-2	(3 means numbers in the code. 2 means
12367	5-2	numbers in the right place.)
62317	5-3	
62371	5-5	

After you input the right code your ship will appear. Press any key. You will then fight the "Rigelian" ships. You need to have a quick trigger finger since the ships will appear constantly. By the way, you only have 5 tries to escape.

After you have typed in the program input the following:

@(0)=-43	@(10)=-247	@(20)=1792	@(30)=0	@(40)=8128
@(1)=19253	@(11)=14414	@(21)=16128	@(31)=1102	@(41)=32512
@(2)=10240	@(12)=-512	@(22)=13024	@(32)=1024	@(42)=-21824
@(3)=20210	@(13)=-512	@(23)=16224	@(33)=1024	@(43)=32672
@(4)=-13871	@(14)=-17920	@(24)=5600	@(34)=3584	@(44)=8128
@(5)=-1936	@(15)=14336	@(25)=5952	@(35)=7936	@(45)=3584
@(6)=-32434	@(16)=31744	@(26)=14912	@(36)=7936	@(46)=32512
@(7)=12288	@(17)=27648	@(27)=736	@(37)=7936	@(47)=25792
@(8)=2432	@(18)=-14848	@(28)=1792	@(38)=15104	@(48)=-3648
@(9)=527	@(19)=0	@(29)=0	@(39)=31616	@(49)=224
				@(50)=0

To record the program, type the following:

```
B=%(20050)+102 (GO)
A=-24576 (GO)
:PRINT; CLEAR; PRINT "A=",A,";B=",B,";FOR N=A TO B;%N)=KP;
NEXT N; %(20050)=B-102; :RETURN; RUN"; FOR N=A TO B; CY=40;
TV=%(N); NEXT N; :RETURN (Start recorder and press GO)
```

CAUTION! Make sure the entire program is correct.

If you stop the program while it is running, you will have to retype the values of @(0) to @(10) because they are wiped out when the program is run.

Have Fun!

## \$100 Prizewinner!

STRANDED AT RIGEL is a two-part game, where you have to determine the code that the machine generates, and having successfully passed that test, you have the villains to contend with. If this portion becomes too difficult, one should be able to bypass this area by a GOTO 500 command.

P.O. Box 11023-San Diego-California-92111

I have an extra Space Fortress cartridge, in the box in perfect condition. I would like to trade this for any Bally road race game. Call 217-789-2102, between 8:30 AM and 5 PM, and ask for Steve or Janeene to arrange trade.

Will pay \$50 to \$100 cash for broken Bally Arcades - send your phone number or ship unit to: R. O'Meara 3178 Arizona Way, Marcellus, NY 13108  
315-673-2359

### ANNOUNCING A BREAKTHROUGH!

We are now able to store and retrieve MLM programs reliably using the Astrovision Basic cartridge. So now, you have the option of using either the old 300 Baud cassette interface, or the new Astrovision Basic cartridge. Quite a breakthrough, we think!

### GOLDFISH DEMO!

Actually they're Neon Tetras, but that would make the name too long. This demo tape is designed to show the power of the Machine Language Manager cartridge. It's a relatively short program, but it independently controls the actions of 7 goldfish, a digital clock, and the meowing of the cat. And it's in 4 colors.

Animation is smooth, and non-blinking. And GOLDFISH does not require MLM to run. The program will run with Bally Basic, Astrovision Basic, and MLM.

An interesting sidelight: Once loaded and running, GOLDFISH no longer needs a cartridge in the slot. You can remove it and the program will keep running until you hit RESET.

# ARCADIAN

PERKINS ENGINEERING has been contracted by Astrocode to finalize the AddUnder. John Perkins, of Artillery Duel and Blue Ram fame, will put the finishing touches to the printed circuit board design that is the basis for the AddUnder wiring, in order to incorporate all the specifications finally agreed upon. (And included in the 6-page item sent to all who asked for it, with SAE); and to make the board more amenable to manufacture.

Up to now, the basic wiring of the AddUnder has been created by hand for each unit, using such techniques as wire-wrap. And each unit has had different capabilities - witness all the different specifications. Now the wiring schematic can be reduced to a printed circuit board design, taking into account the manufacturing process of 'board stuffing' that must take place. For example, like parts should be grouped together, so that the machine operator can install them quickly. It is better to have all 470 ohm resistors for example, right next to each other, than have them scattered over the board. Remember, we are not talking about a board being packed by hand, but an assembly line where 15-20 boards per hour go through each station.

AUTHORS/SUBJECTS WANTED We want to increase the amount of textual material included in the ARCADIANS as well as the program material. We would therefore like to build up a cadre of technical writers who could be called upon to handle various subject areas. But not only do we need authors, we need subjects as well. Drop us a line on what you would like to see explained, or an area where clarification is needed, etc.; or if you would be willing to share your expertise. A question/answer segment might be the way to start this off, so lets hear from you.

SPECTRE'S MISSILE COMMAND, a program developed to utilize the improved hand controllers marketed by Spectre, is in the process of being converted into a game cartridge, so that you will be able to plug it into the game slot. Contact them at 14430 Barclay, Dearborn MI 48126 for info.

LOS ANGELES OWNERS INVITED to an Open House and general meeting in July for all Astrocode enthusiasts in the Los Angeles area. Call or write:

Mark Kruvulka  
HOME ARCADE ELECTRONICS

El Monte 91732 (213) 443-4189

LINE NUMBERS There are two ways to command the Arcade to perform an operation; the "executive mode" whereby the command you type in will be done immediately upon pressing GO, and the more normal delayed method where you accumulate a batch of commands and the machine performs them in an orderly manner when you type RUN. The orderliness is created by the "LINE NUMBER" scheme.

Each command is given a line number, from 1 on up. The line number is typed first, then the command or other statement. As long as you do not press GO the material on the screen can be modified in any way. When GO is pressed, the line number and statement are stored in memory for future use. Line numbers don't have to start with 1, most programs start with '10'. You don't have to enter them in numerical order - the machine fixes that automatically. You can also save a little memory space by ending a line with a semi-colon ; and immediately starting the next command. This ploy will work as long as: a) you don't exceed 182 characters on a line; or b) you don't set up an IF statement. (no ; allowed after an IF statement.)

One of the uses of the new Astrocode Basic EDIT function is the changing of line numbers. Suppose you got into a box, and the only way to get around it was to change a line number to something else. Say the command was 251 FOR A = 1 TO 40 and you had to change the line number to 389.

Type 251 PAUSE which gets you into the EDIT mode, and you see 251 FOR on the screen. Use the ERASE key to wipe out the FOR 1 5 2 and then retype the new number and the wiped-out command - 389 FOR continued use of the PAUSE key will bring back the rest of the line. Try a LIST 389,1 to see if the new line is correct. Then wipe out the old line by typing 251 GO . Don't forget that you have to replace the entry immediately after the line number. (This paragraph was based on material submitted by Ken Lill, who has other material in this issue. I took some editorial license and moved it into this area.)

There is a sort of standard procedure in program writing that places an interval of 10 between line numbers in a program. It is a convenience because it enables one to add more line numbers between existing lines in case it is necessary. The Arcade unit has the +10 key which automatically gives you a line number 10 higher than the previous one, so that by keying in (WORD\$) GO the machine not only enters the statement, but adds 10 to the line number and displays it ready for the next command entry.

July 6, 1982

PERKINS ENGINEERING has been contracted by Astracade to finalize the AddUnder. John Perkins, of Artillery Dual and Blue Ram fame, will put the finishing touches to the printed circuit board design that is the basis for the AddUnder wiring, in order to incorporate all the specifications finally agreed upon. (And included in the 6-page item sent to all who asked for it, with SAE); and to make the board more amenable to manufacture.

Up to now, the basic wiring of the AddUnder has been created by hand for each unit, using such techniques as wire-wrap. And each unit has had different capabilities - witness all the different specifications. Now the wiring schematic can be reduced to a printed circuit board design, taking into account the manufacturing process of 'board stuffing' that must take place. For example, like parts should be grouped together, so that the machine operator can install them quickly. It is better to have all 470 ohm resistors for example, right next to each other, than have them scattered over the board. Remember, we are not talking about a board being packed by hand, but an assembly line where 15-20 boards per hour go through each station.

**AUTHORS/SUBJECTS WANTED** We want to increase the amount of textual material included in the ARCADIAN as well as the program material. We would therefore like to build up a cadre of technical writers who could be called upon to handle various subject areas. But not only do we need authors, we need subjects as well. Drop us a line on what you would like to see explained, or an area where clarification is needed, etc.; or if you would be willing to share your expertise. A question/answer segment might be the way to start this off, so lets hear from you.

SPECTRE'S MISSILE COMMAND, a program developed to utilize the improved hand controllers marketed by Spectre, is in the process of being converted into a game cartridge, so that you will be able to plug it into the game slot. Contact them at 14430 Barclay, Dearborn MI 48126 for info.

LOS ANGELES OWNERS INVITED to an Open House and general meeting in July for all Astracade enthusiasts in the Los Angeles area. Call or write:

El Monte 91732 (213) 443-4189

Printed for the mutual edification of the publisher and subscribers who are owners of the ARCADE unit, its programmable BASIC cartridges, and the ZGress language. Printing is by a COMPTRON 912S (programs) and a NEC 8023 (text - driven by an Apple with Super-Text and Magic Window word processing systems.)

Since the deadline is 95 percent subscriber-generated, material is always in demand. Text material should be submitted as typewritten copy, preferably 47 characters per row at single speed. Program material should be submitted both as a listing and on tape. Contributions are accepted without payment. However, programs that are new (according to the author) and a signed statement indicating "this program is largely my own efforts and not a copy of an existing program" will be eligible for a prize. At least three programs are required for the Contest to operate. A panel of five judges will determine which of the submitted programs is "best." In addition, it is our policy to accumulate certain programs for subsequent sale on a tape, for which an author's royalty will be paid.

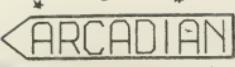

**LINE NUMBERS** There are two ways to command the Arcade to perform an operation; the "executive mode" whereby the command you type in will be done immediately upon pressing GO, and the more normal delayed method where you accumulate a batch of commands and the machine performs them in an orderly manner when you type RUN. The orderliness is created by the "LINE NUMBER" scheme.

Each command is given a line number, from 1 on up. The line number is typed first, then the command or other statement. As long as you do not press GO the material on the screen can be modified in any way. When GO is pressed, the line number and statement are stored in memory for future use. Line numbers don't have to start with 1, most programs start with 10\*. You don't have to enter them in numerical order - the machine fixes that automatically. You can also save a little memory space by ending a line with a semi-colon ; and immediately starting the next command. This play will work as long as: a) you don't exceed 102 characters on a line; or b) you don't set up an IF statement. (no; allowed after an IF statement.)

One of the uses of the new Astracade Basic EDIT function is the changing of line numbers. Suppose you got into a box, and the only way to get around it was to change a line number to something else. Say the command was 251 FOR A = 1 TO 48 and you had to change the line number to 389.

Type 251 PAUSE which gets you into the EDIT mode, and you see 251 FOR on the screen. Use the ERASE key to wipe out the FOR 1 5 2 and then retype the new number and the wiped-out command - 389 FOR continued use of the PAUSE key will bring back the rest of the line. Try a LIST 389,1 to see if the new line is correct. Then wipe out the old line by typing 251 GO . Don't forget that you have to replace the entry immediately after the line number. (This paragraph was based on material submitted by Ken Lill, who has other material in this issue. I took some editorial license and moved it into this area.)

There is a sort of standard procedure in program writing that places an interval of 10 between line numbers in a program. It is a convenience because it enables one to add more line numbers between existing lines in case it is necessary. The Arcade unit has the +10 key which automatically gives you a line number 10 higher than the previous one, so that by keying in (WORDS) GO the machine not only enters the statement, but adds 10 to the line number and displays it ready for the next command entry.

POLO is a two player game where the object is to score the most goals before time runs out. The computer will roll the dice and indicate the player who is up by making his horse blink off & on. The player then determines the best direction to move (up,down,diagonal) the number of squares on the dice, and uses JX & JY to make his move. If he lands in the opponents goal he scores 5 pts. If he lands on one of his own 'Lucky Horse Shoes' he scores 1 pt. and gets another turn, else play passes to his opponent. Each player has 15 sec. to make his move, or lose his turn. A defensive player can move his goalie up or down using JY. When time runs out, another period can be played by setting JY(1)-1. A new game is started with JY(1)--1.

CATCHEM: Player (1) uses his joystick to maneuver his blip through the pattern, avoiding Player (2)'s blip. If Player (2) is successful in overlaying his blip on the other one, he gets a point. Three points to win. Patterns are drawn randomly. The program is written in Astro Basic, and can be played in Bally Basic by deleting lines 7031, 7032, and 7050. Program is on page 89.

## ASTRO ZAP 2000 BY GEORGE MOSES

ASTRO ZAP is similar to the commercial arcade game "SPACE ZAP" by Midway, only you don't need a quarter to play. It will keep score for up to four humans, using 1 hand control for each. When you RUN the program, input the number of players from the keypad. When the game starts you will use only the joystick to fire back at the invading missiles. No trigger is necessary. You will receive 250 points for each missile you eliminate. A Kamikaze will orbit your space fortress at random intervals. You must shoot it down before the second orbit or it will dive into you. Each human begins with three bases and will be awarded a bonus base every 10,000 points. As points accumulate the missiles will travel faster until you can no longer keep up with the onslaught. If the missile hits the base there will be a terrible explosion which goes on and on and on. If you get sick of watching yourself explode, pull the trigger to abort the fireworks. This will bring up the next player's turn. The only other use of the trigger is at the GAME OVER display if you wish to start a new game.

**IMPORTANT.** Never put any spaces in this program unless you see the "■" symbol. Any spaces you see are only in there for clarity. A word of caution about the letter "O" (as in OH). It is used as a variable in lines 21, 22, 101 and 510. Use care not to confuse it with the "0" (as in zero.) Also use the computer command word "INPUT" in line 500 instead of typing the word out. You should have 47 bytes of memory left, a minimum of 40 bytes are needed to handle the scorekeeping strings.

Because all memory is used up the variables R through Z must be loaded as direct commands from the keypad to make this program work.

Type the following without a line number:

R = 100;S = 200;T = 250;U = 300;V = 1000;
W = 160;X = 500;Y = 510;Z = 16;RUN

WHEN YOU PRESS GO your program should run perfectly. To save the program on tape just use :PRINT GO with your recorder running on RECORD.

100 PRIZE WINNER

## 16384 BYTES OF RAM FOR YOUR ARCADE!

The Blue Ram by Perkins Engineering has already opened the door to hundreds of creative programmers who love the powerful graphics and sound capabilities of the Astrocade, but were stymied by its lack of random access memory. Now more!

Now, instantly, you can have 16384 bytes of additional memory. You can use the Blue Ram to copy a game cartridge on regular cassette tape using the machine language routines included in the Blue Ram's instruction manual. Or, you can copy a game cartridge to an existing game cartridge! Write your own cartridge! And, with the 24 port socket on the Blue Ram you can adapt your computer to drive a modem, a printer, a keyboard and many other applications! Regular price is \$249.95.

**Blue Ram Extended Basic Cartridge**  
Written by Jay R. Johnson, President of Perkins Engineering, the Blue Ram has exclusive input and output ports, hardware and software switching mechanisms, and the Astrocade's outstanding game and graphics design capabilities. Gives up to 15,500 bytes of programming space with space for BASIC, CIRCLE, and SNAKE commands, 4 colors, built-in memory routines, keyboard and joystick driving, 300 baud or 2000 baud data output and much more! Will not operate without a Blue Ram or other extended memory. Regular price is \$49.95.

## 16384 BYTES OF RAM FOR YOUR ARCADE!

The Blue Ram by Perkins Engineering has already opened up a whole new world of possibilities for powerful graphics and sound capabilities in the Astrocade, but were stymied by its lack of random access memory (RAM). No more! Now, instantly, you can have 16384 bytes of additional memory. You can add the Blue Ram to your Astrocade via a regular cassette tape using the machine language routines included in the Blue Ram Utility program. Learn Z-80 machine code and modify an existing game cartridge! Write your own cartridge! And, with the 24 port socket on the Blue Ram you can adapt your computer to drive a modem, a printer, a keyboard and many other applications! Regular price is \$249.95.

**Blue Ram Extended Basic Cartridge**  
Written by Jay Fenton and John Perkins to take advantage of the Blue Ram's exclusive input and output port features, the software switches between the Astrocade's outstanding game and graphics design capabilities. Gives up to 15,500 bytes of programming space with special POINT, CIRCLE and SNAP commands, 4 colors, 16 levels of graphics, 16 levels of sound, 16 levels of 300 baud or 2000 baud data output and much more! Will not operate without a Blue Ram or other extended memory. Regular price is \$49.95.

**INTRODUCTORY OFFER!  
New 16K Blue Ram and  
the Extended Basic  
Cartridge, a \$300.00 value**

# ARCADIAN

## USING THE "EDITOR" OF THE ASTRO-BASIC

One of the best things that Jay Fenton put into the "new" BASIC cartridge is the EDITOR. With it you can change any information in any line INCLUDING the line number, with EASE! I've worked with "EDIT" features of other computers and I believe that ASTRO'S is the easiest! Let's take a sample program:

```
)10 FOR A=0TO100STEP10  
 )20 NEXT A;@(A)=A  
 )30 *(A)=@(A)
```

```
)40 PRINT A;PRINT @(A);PRINT *(A)
```

Let's say you want line )10 to read:

```
)10 FOR A=0TO10STEP 2
```

First KEY-IN 10 and then press the PAUSE\* button until you see the second "0" in the number 100, hit the ERASE key once. Then press the PAUSE key to get the word STEP to appear. KEY-IN the number 2 and hit GO. Now your "EDITing" is done! Easy, wasn't it?

Now let's add something to line )30. KEY-IN 30 and press PAUSE until you get to the "=" sign. Now KEY-IN A;. Press PAUSE until the last BYTE of the line ")=" appears on the screen, and KEY-IN =A. Now KEY-IN CLEAR;LIST GO. Your LISTing should look like this:

```
)10 FOR A=0TO10STEP 2
```

```
)20 NEXT A;@(A)=A
```

```
)30 *(A)=A;@(A)=A
```

```
)40 PRINT A;PRINT @(A);PRINT *(A)
```

Let's change line )20 to make it line )50. First KEY-IN 20, and press the PAUSE only ONCE. the word NEXT should be on the screen. Now press ERASE until the line number has been ERASED. Don't worry, you can't ERASE out of the EDITor mode! Now put the new line number in, 50, and KEY-IN the BYTE you ERASEd from the line, NEXT. Press the PAUSE once again. Since you have already put @(A)=A in )30, you can now press GO. Press CLEAR;LIST GO again and your LISTing should now look like this:

```
)10 FOR A=0TO 20STEP 2
```

Ken Lill

```
)20 NEXT A;@(A)=A
```

5039 S. Elizabeth

```
)30 *(A)=A;@(A)=A
```

Chicago, Ill. 60609

```
)40 PRINT A;PRINT @(A);PRINT *(A)
```

```
)50 NEXT A
```

Now all you need to do to complete your program is to KEY-IN 20 GO. This will delete line )20.

### EXITING THE "EDITOR" MODE

There are four ways to exit the EDITor mode. They are:

1. Press PAUSE until you have gone PAST the last byte of the line you have EDITed. This will place the corrected line into the memory!
2. Press HALT. This will NOT put any of your corrections into the line! Instead, it will leave the line as it was BEFORE you used the EDITor!!!
3. Press GO . This will put your EDITed line into memory MINUS any data that may have been in the line AFTER the point you pressed GO
4. Press RESET . We all know what happens then-- GOODBYE PROGRAM!!!!!!

\*Pressing WORDS SPACE has the same effect as pressing PAUSE to enter, work with, or exit the EDITor!!!

### ATTENTION!!

Amonging a few cases in a lifetime chance to purchase an astro basic software library at less than half of the original cost. (Everything is clean and in new or near new condition.)

Bally Astrocode (wood grain finish)

2 handcontrols

DISKETTE..Interface..Instruction Book & storage box

New Basic..Power cord..Instruction Book

Videoconsoles...

Speaker 7 MinDisc

Football

Baseball / Tennis

Bally Pinball

Crash / Backyard

Space Invaders

Galactic Invasion

Ultimate Basketball

Maze Mania / Maze Manager w/ demo tape & manual

Se Minicircuits w/ demo & musical tape

Several third party software tapes (all include instructions & listings)

Wave Makers tapes 3, 5, 8, 9, 10, 11, 12, and Hokey Pokey (w/ Gong the Kong)

21 L. M. program

All Asteroids programs

All Mark Keller programs

All Tiny Arcade programs

All Video Wonders programs

16 cassette tapes (old basic) with typed index...includes almost all programs available in the Arcadian and Cursor newsletters.

4 New Basic tapes (comes with most every program available) in New Basic

These 4 cassettes are \$10 each individually. All cassettes have case.

Customized clear plastic dust cover. Comes with track port and reset/eject button to protect from accidental reset while programming.

The Arcadian Vol. 1 & 2 and Vol. 3 & 4 complete up to current issue. In two notebooks, tabbed by issue, with table of contents and index.

All Cursor and Basic Express with index, in notebook.

Summer 1982 Sourcebook.

To purchase all of this new you would spend over \$1,265.

The old Basic and Interface are no longer available in any stores.

You can purchase the complete set for less than half of original cost.

The first serious \$600 offer gets it all. (Or the best offer by Sept. '82).

To make payment and delivery arrangements call 319-355-0469 or send a letter with your number to Ken Springer 1935 Winding Hill Rd. #1008 Davenport, Ia. Zip 52627

## USING THE "EDITOR" OF THE ASTRO-BASIC

One of the best things that Jay Fenton put into the "new" BASIC cartridge is the EDITOR. With it you can change any information in any line INCLUDING the line number, with EASE! I've worked with "EDIT" features of other computers and I believe that ASTRO'S is the easiest! Let's take a sample program:

>10 FOR A=0TO100STEP10

→ 20 NEXT A; @ (A) = A

$\Rightarrow 30 \cdot \{A\} = \emptyset \{A\}$

```
>40 PRINT A:PRINT @ (A):PRINT *(A)
```

Let's say you want

10 FOR A=0 TO 10 STEP 2  
First KEY-IN 10 and then press the PAUSE\* button until you see the second "0" in the number 100. hit the ERASE key once. Then press the PAUSE key to get the word STEP to appear. KEY-IN the number 2 and hit GO. Now your "EDITING" is done! Easy, wasn't it?

Now let's add something to line #30. KEY-IN 30 and press PAUSE until you get to the "=" sign. Now KEY-IN A<sub>1</sub>. Press PAUSE until the last BYTE of the line ")" appears on the screen, and KEY-IN =A.

Now KEY-IN CLEAR;LIST GO. Your LISTing should look like this:

)10 FOR A=0TO10STEP 2

>20 NEXT A;E(A)=A

$$32 + A = A; \emptyset(A) = A$$

```
>40 PRINT A;PRINT @ (A);PRINT *(A)
```

Let's change line 20 to make it line 50. First KEY-IN 20, and press the PAUSE only ONCE, the word NEXT should be on the screen. Now press ERASE until the line number has been ERASED. Don't worry, you can't ERASE out of the EDITOR mode! Now put the new line number in, 50, and KEY-IN the BYE you ERASED from the line, NEXT. Press the PAUSE once again. Since you have already put @A=A in #30, you can now press GO. Press CLEAR;LIST GO again and your LISTING should now look like this:

) 10 FOR A=0 TO 20 STEP 2

>20 NEXT B:=B(B)=B

$$32. f(A) = A \circ g(A) = A$$

```
>42 PRINT A:PRINT S(A):PRINT T(A)
```

150 NEXT 8

Now all you need to do to complete your program is to KEY-IN 20 GO. This will delete line 10.  
EXITING THE EDITOR MODE

There are four ways to exit the EDITOR mode. They are:

1. Press PAUSE until you have gone PAST the last byte of the line you have EDITed. This will place the corrected line into the memory!
2. Press HALT. This will NOT put any of your corrections into the line! Instead, it will leave the line as it was BEFORE you used the EDITOR!!!
3. Press GO . This will put your EDITed line into memory MINUS any data that may have been in the line AFTER the point you pressed GO
4. Press RESET. We all know what happens then-- GOODBYE PROGRAM!!!!!!

\*Pressing WORDS SPACE has the same effect as pressing PAUSE to enter, work with, or exit the EDITORIAL.

ATTENTION!  
Announcing a once in a lifetime chance to purchase an extensive hardware & software library at less than half of the original cost. (Everything is clean and in new or near new condition.)

Bally Astrocade (wood grain finish)  
2 hand controllers  
1 joystick  
1 light gun interface.., Instruction Book & storage box  
Wes Hamlin...Patch cord..Instruction Book  
#1 decodes, etc.

7  
Sesame Street / Missle

All Mark Keller programs  
All Tiny Arcade programs  
All Tiger-Plugins programs

16 cassette tapes (old band) with typed index...includes almost all programs available in the Arcadian and Router newsletters.  
W. Gwin, TEC's (picked with most every program available) in *Wes Basic*.  
Programs are indexed individually. All cassettes have cases.  
Characterized class, plastic cases. Covers videotape port and reset/eject button to protect from accidental reset during programming.  
The Arcadian Vol. 1, 2 & Vol. 3, 4 complete to current issue. In two notebooks, tabbed off by issue, with table of contents and index.  
All Currcan and Basic Express with index, in notebook.

To purchase all of this new you would spend over \$1,355.  
The old Basic and Interface are no longer available in any stores.  
You can purchase the complete set for less than half of original cost.  
The first serious \$600 offer gets it all. (Or the last offer by Sept. '82).  
To make payment and delivery arrangements call 319-355-4460 or send a letter  
with your number to Ken Springsteen 1935 Winding Hill Rd., #1008 Davenport, IA.

From the company that was the first to bring you 16K memory expansion, a professional 62-key full size ASCII keyboard, and the excellent Extended Basic language -- we would like to announce our first software contest. The winner of this contest will receive a complete Viper Operating System or \$500 in cash!! The Viper Operating System includes these items:

- 3K dynamic RAM memory
- 1 Viper keyboard (with extension cable)
- 1 Viper dual port-bidirectional RS232 communications board
- 1 Extended Basic cartridge with 2K/4K baud tape interface
- 1 5-slot micro expander bus with terminator card
- 1 Viper cabinet with power interface board and cable

All entries must include a listing with comments, and the program on tape. Any language is acceptable (AB, BB, EB, machine code, etc) and there are no restraints on the program - any program type will be allowed (examples: educational, game, business, etc) - and the winning program will be chosen on its creativity and originality.

Programs previously or currently offered for sale will not be eligible. The winning entry will become the property of Alternative Engineering Co., The judging will be done by AEC personnel and the results will be final. The contest is now in operation and will end Oct 20, 1982. The winner will be notified by Nov 5, 1982.

We do more than talk expansion - we make it a reality!! Look for the entry blank in the next issue of the ARCADIAN.

#### INSTRUCTIONS for Battleship:

START WITH REGULAR VERSION (0)

START PLAY WITH PLAYER #1 PLACING (HIDING) HIS FLEET OF SHIPS  
(DON'T LET THE ENEMY WATCH!)

THE JOYSTICK CONTROLS WHERE EACH SHIP IS TO BE PLACED, THE TRIGGER PUTS IT IN

ALL SHIPS MUST BE PLACED IN A STRAIGHT LINE, EITHER HORIZONTAL, VERTICAL, OR DIAGONAL

ALL SHIPS OF THE SAME TYPE MUST TOUCH EACH OTHER

SHIPS NOT OF THE SAME TYPE MAY BUT DO NOT HAVE TO TOUCH EACH OTHER

EACH PLAYER STARTS WITH THE SAME COMPLIMENT OF SHIPS AS FOLLOWS:

- 5 AIRCRAFTCARRIERS (A)
- 4 BATTLESHIPS (B)
- 4 DESTROYERS (D)
- 3 CRUISERS (C)
- 2 SUBS (S)

AFTER BOTH PLAYERS HAVE PLACED THEIR FLEETS THEY MAY SHOOT THEIR 3 SHOT SALVOS,  
USING THE JOYSTICK TO LOCATE AND THE TRIGGER TO FIRE EACH SHOT

HITS ARE NOT SHOWN UNTIL AFTER ALL 3 SHOTS ARE FIRED

ALL HITS ARE DISPLAYED BY SHIP TYPE

Note that the Advanced Version (1) shows only a "+" for hits, making it more difficult to analyze the board.

## VIPER Contest:\*

# 16384 BYTES OF RAM FOR YOUR ARCADE!

The **Blue Ram** by Perkins Engineering has already opened its door to hundreds of creative programmers who love the powerful graphics and sound capabilities in the Astrocade, but were stymied by its lack of random access memory (RAM). No more! Now, instantly, you can have 16384 bytes of additional memory.

You can use the Blue Ram to copy a game cartridge on regular cassette tape using the machine language routines included in the Blue Ram Utility program. Learn Z-80 machine code and modify an existing game cartridge! Write your own cartridge! And, with the 24 port socket on the Blue Ram you can adapt your computer to drive a modem, a printer, a keyboard and many other applications! Regular price is \$249.95.

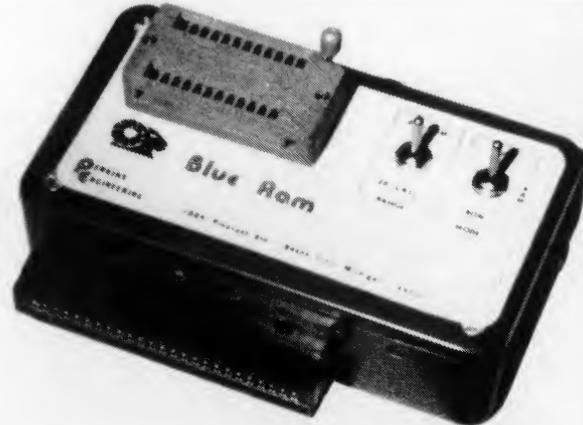

## Blue Ram Extended Basic Cartridge

Written by Jay Fenton and John Perkins to take advantage of the Blue Ram's exclusive input and output ports, hardware and software switching mechanisms, and the Astrocade's outstanding game and graphics design capabilities. Gives up to 15,500 bytes of programming space with special POINT, CIRCLE and SNAP commands, 4 colors, built-in math routines, keyboard and printer-driving logic, 300 baud or 2000 baud data output and much more! Will not operate without a Blue Ram or other extended memory. Regular price is \$49.95.

1004 Pleasant Ave., Boyne City, Michigan 49712 Phone (616) 582-9832

When ordering specify whether you have  
300 baud Bally Basic or 2000 baud Astrocade Basic

## Whiz Quiz

**TAPE**  
**(11)**

WHIZ QUIZ--TRIVIA. THIS IS THE FIRST PROGRAM OF IT'S KIND. IT'S NOT LIMITED BY THE AMOUNT OF MEMORY IN THE BALLY, SINCE ALL THE QUESTIONS ARE FED FROM THE TAPE TO THE COMPUTER. (OVER 250 TOTAL QUESTIONS) THESE ARE ALL MULTIPLE CHOICE QUESTIONS AND THE ANSWERS ARE SELECTED WITH THE HAND CONTROL. THE COMPUTER KEEPS TRACK OF RIGHT AND WRONG ANSWERS. WE'VE GIVEN YOU A BIG VARIETY OF QUESTIONS RANGING FROM ASTROLOGY TO TV TRIVIA. THEY MAY NOT SEPARATE THE DUMMYS FROM THE EINSTEINS BUT THEY SHOULD GIVE YOU A GOOD IDEA WHO KNOWS, WHAT'S WHAT,WHO'S WHO, HOW MANY, WHEN WAS, AND WHO CARES ANYWAY!!!! FOR ALL THOSE WHO LOVE TRIVIA, DON'T MISS WAVEMAKERS TAPE 11 WHIZ QUIZ.
